GRICES

EST. 1978

HYDRAULIC CYLINDERS

Grices is a family run company founded in 1978 by *Mr. Bruno Cesana*, and is specialized in the production of high quality hydraulic cylinders for industrial and naval applications. As a result of over **35 years experience** in the hydraulic market, Grices has earned an important position in the national and international market granting functionality, safety and reliability to all customers.

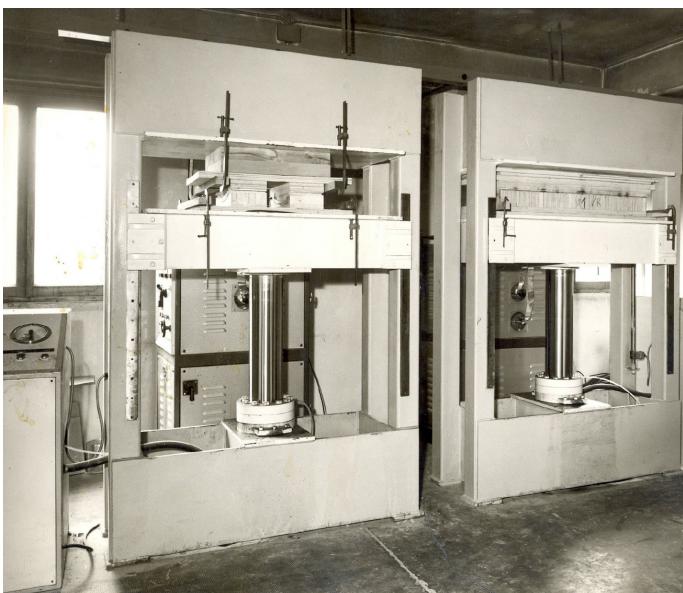

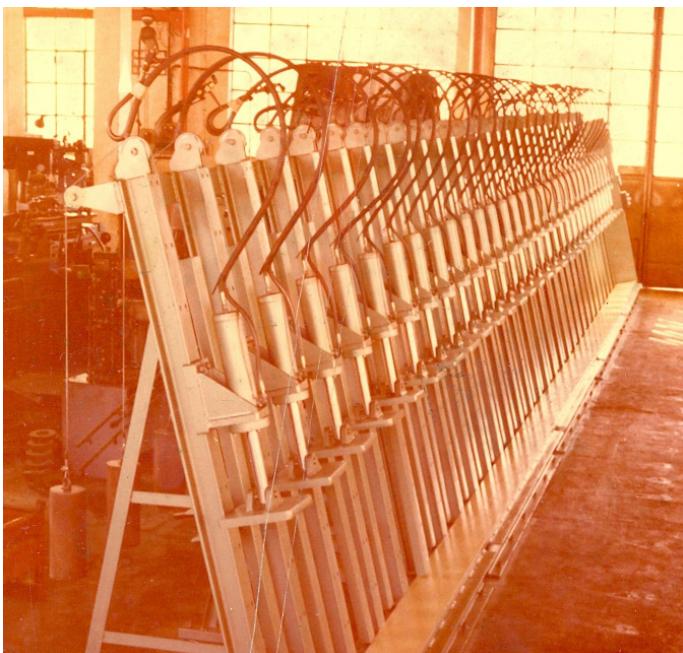

Thanks to the modular design, cutting-edge production machines and productive procedures , we can offer both standard cylinders **ISO/DIN/CNOMO** as well as **customized cylinders** designed by our technical team or from designs provided by the customer.

Grices provides competitive solutions for OEM applications and spare parts for many of the major international producers, granting complete compatibility. The skills and experience of the technical team allows us to closely collaborate with the customer in order to assist in choosing the best technical solutions for the requested application, offering flexibility and competence. Grices pays particular attention to the choice of raw materials, machining and assembly, assuring reliability and durability.

Grices offer:

- High quality standard and customized cylinders
- **Bore up to 400 mm** , stroke up to **4000 mm** , pressure up to **80MPa**
- A complete range of products
- International distribution
- Online cylinder configurator (EPC)
- Download drawings **CAD 2D and 3D**
- Direct technical support
- Hydraulic test on **100%** of all cylinders produced
- Complete tracking of production and delivery
- Quick delivery
- Competitive prices
- Last generation of machines interconnected by intranet system
- Qualified welders
- Internal production of all components
- Professionalism from beginning to end of the project
- **100% made in Italy**

EPC ONLINE CONFIGURATOR

QUICK
AND INTUITIVE

EPC allows the configuration of all Grices' series in a quick and intuitive way, guiding you in the choice of all available options.

The **user friendly** interface makes the cylinder's code creation a simple process, and the cylinders' lists feature allows you to easily organize your codes.

With the **EPC** configurator you can download **2D, 3D** and **PDF** drawings (SAT, DWG, DXF formats), request quotes online, monitor the order progress, modify the delivery time and make orders online, receiving extra discounts. Thousands of clients already use this service, which simplify the tasks of both technical and commercial departments.

Sign up for our EPC configurator through the dedicated box, or send an e-mail to **sales@grices.it** requesting access.

MAIN ADVANTAGES

Shorter commission time

Thanks to the Grices EPC configurator you can create cylinders suited to your needs in a short time.

Intuitive interface

The user-friendly EPC interface allows you to create your cylinders following a simple guided path.

Offer requests

Once your list creation process has ended, you can request an offer directly online that will be sent to you from our server.

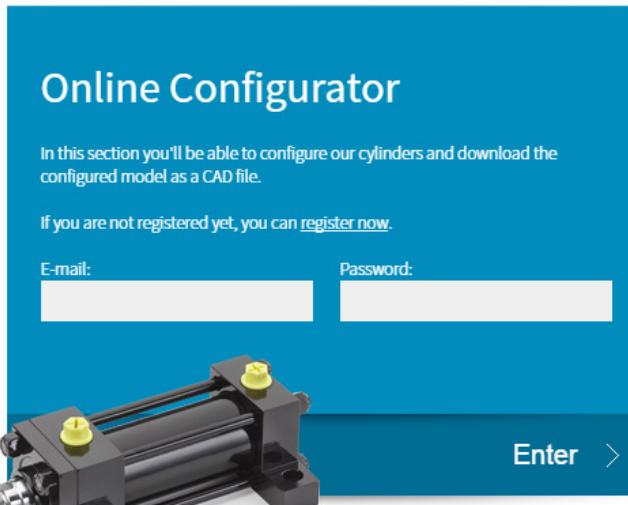

Download 2D, 3D, PDF drawings

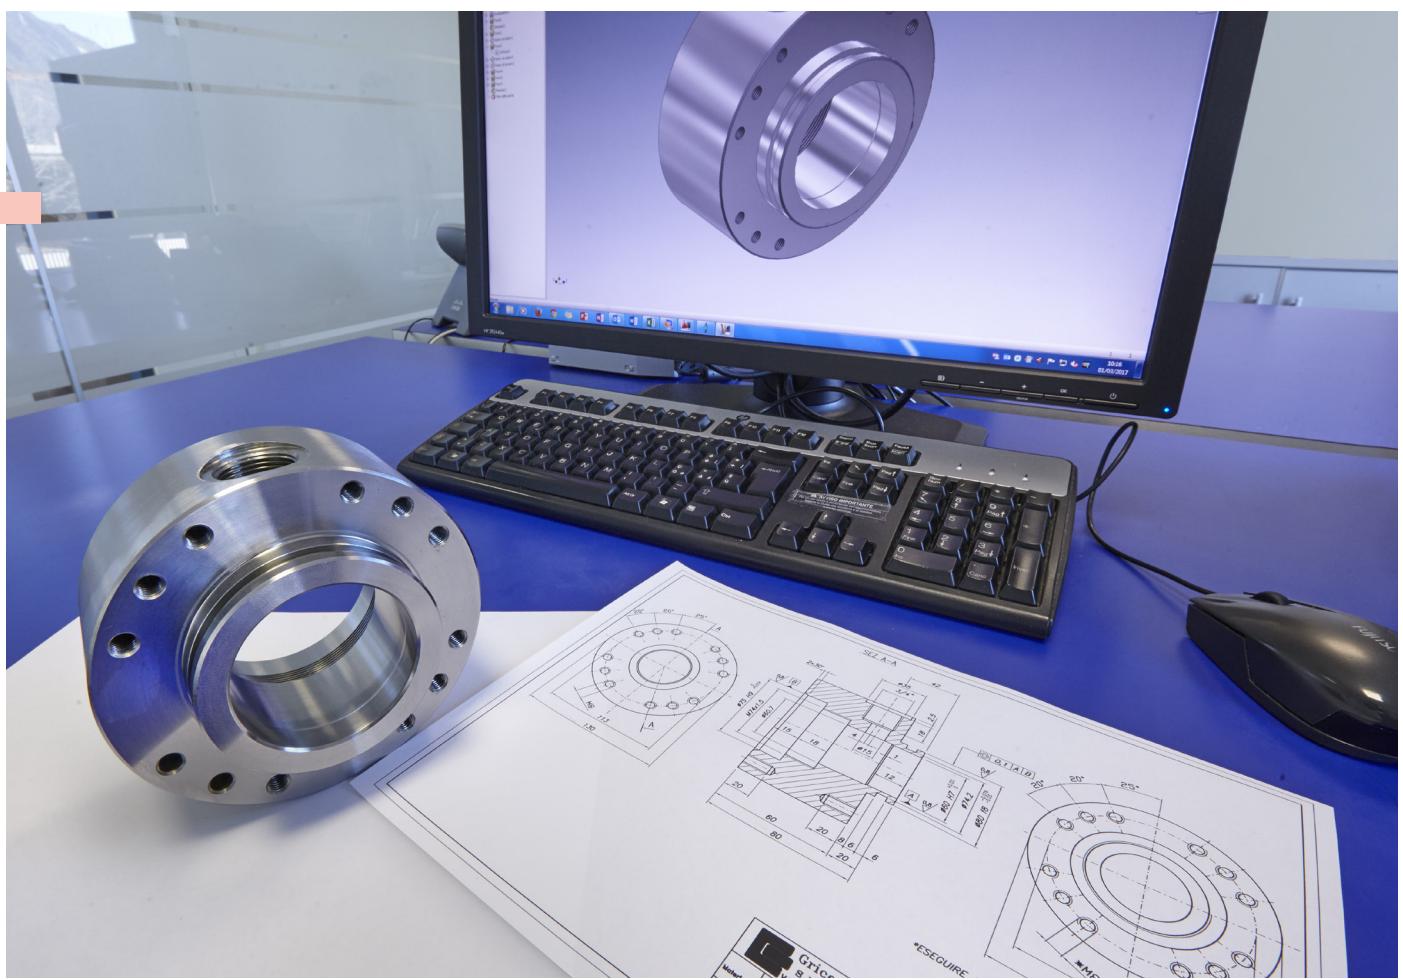

Download the drawings of the cylinder that you have created. Most of the formats are available: SAT, DWG, DXF, PDF.

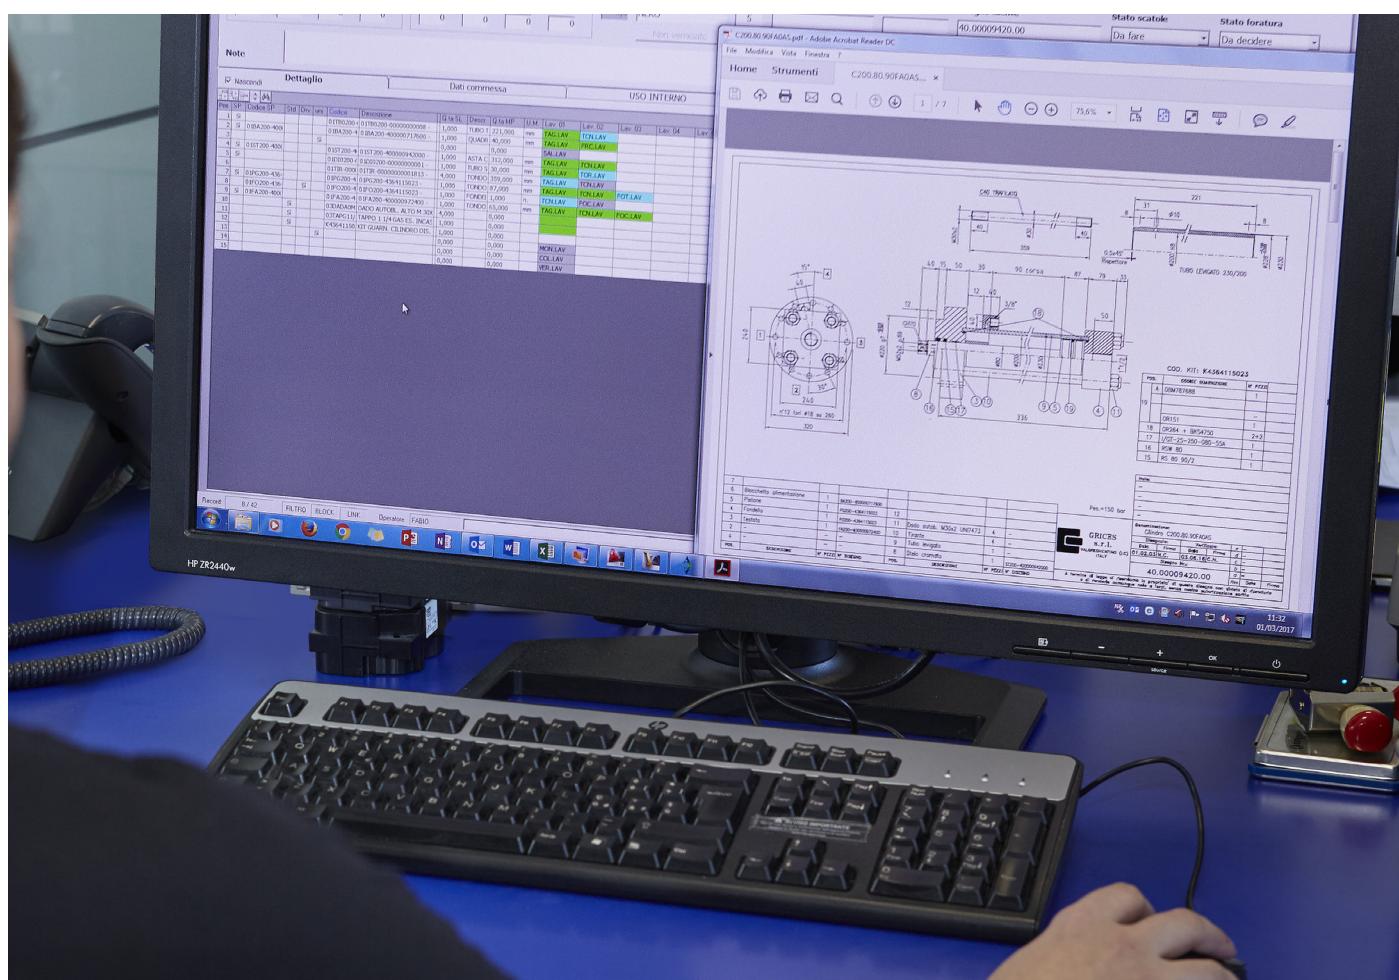

Online orders

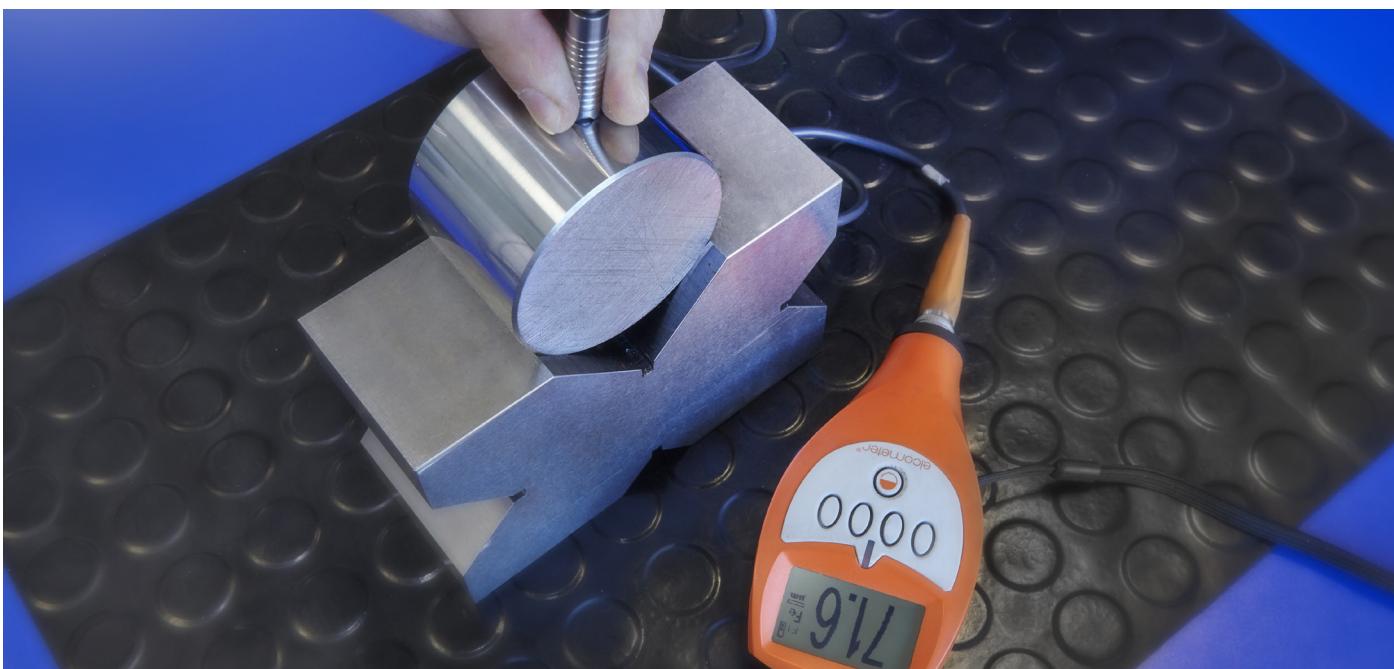

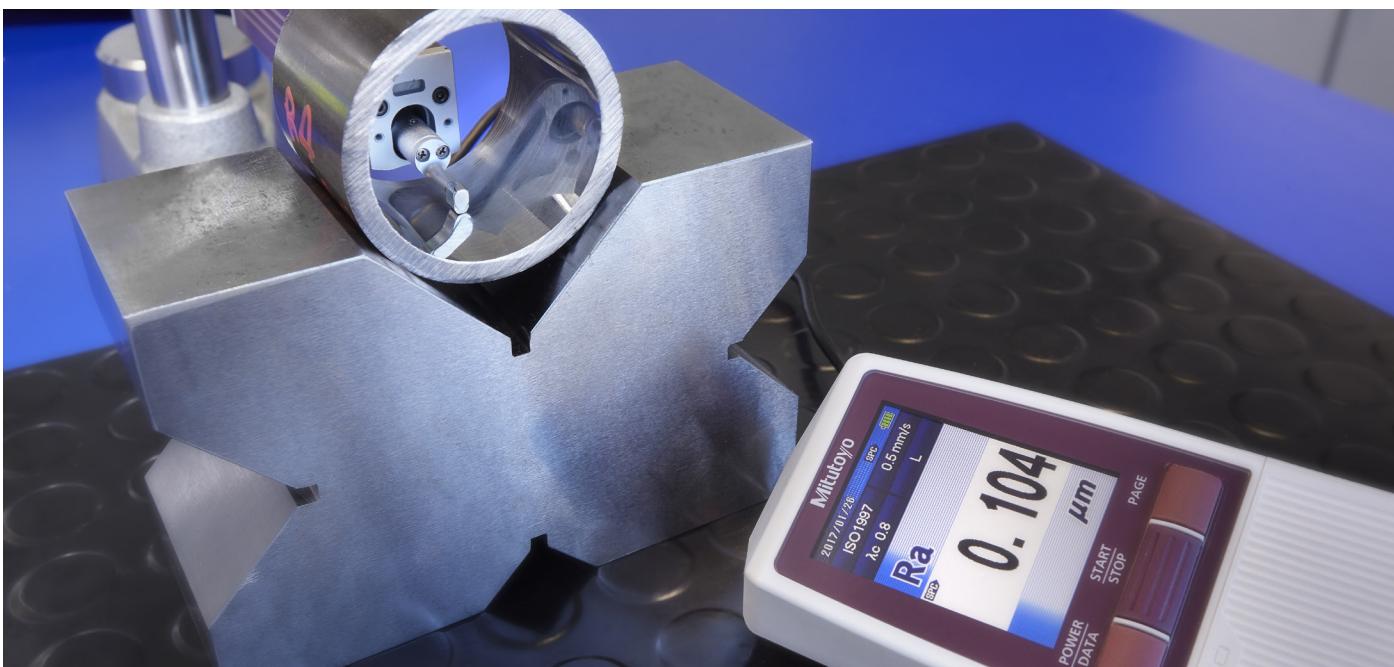

Make orders directly from our **EPC Configurator** receiving extra discounts.

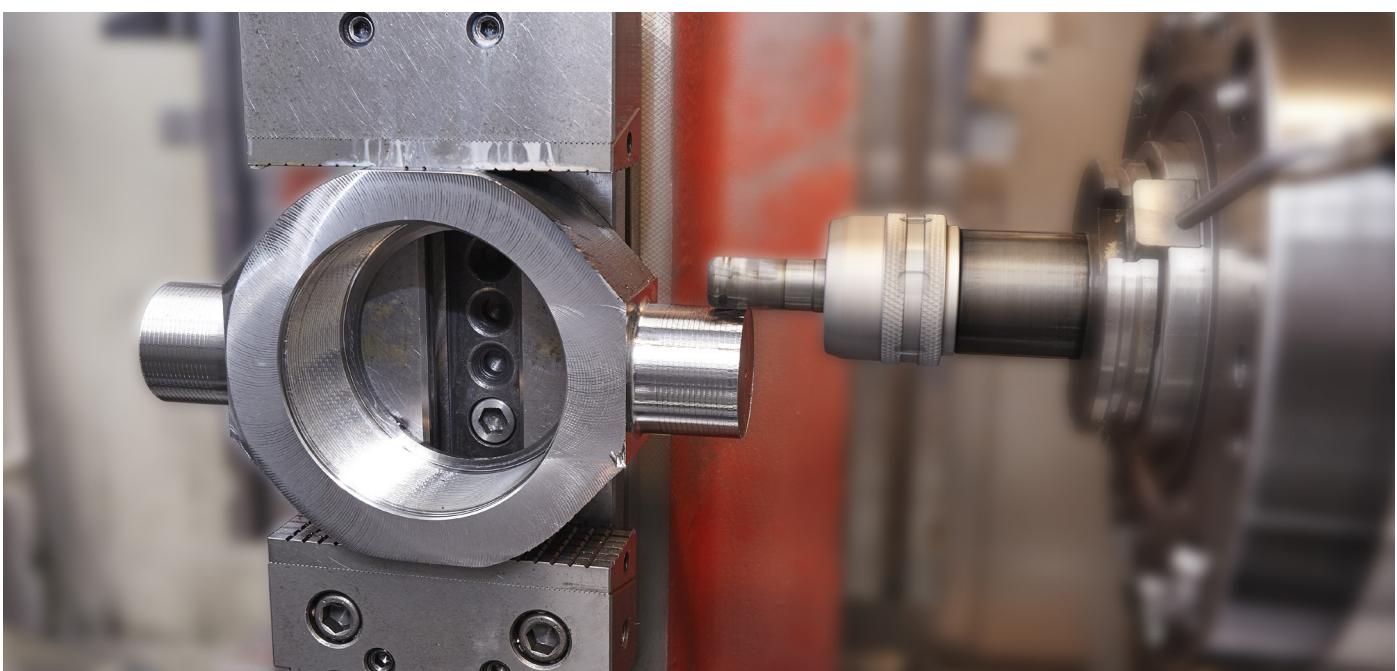

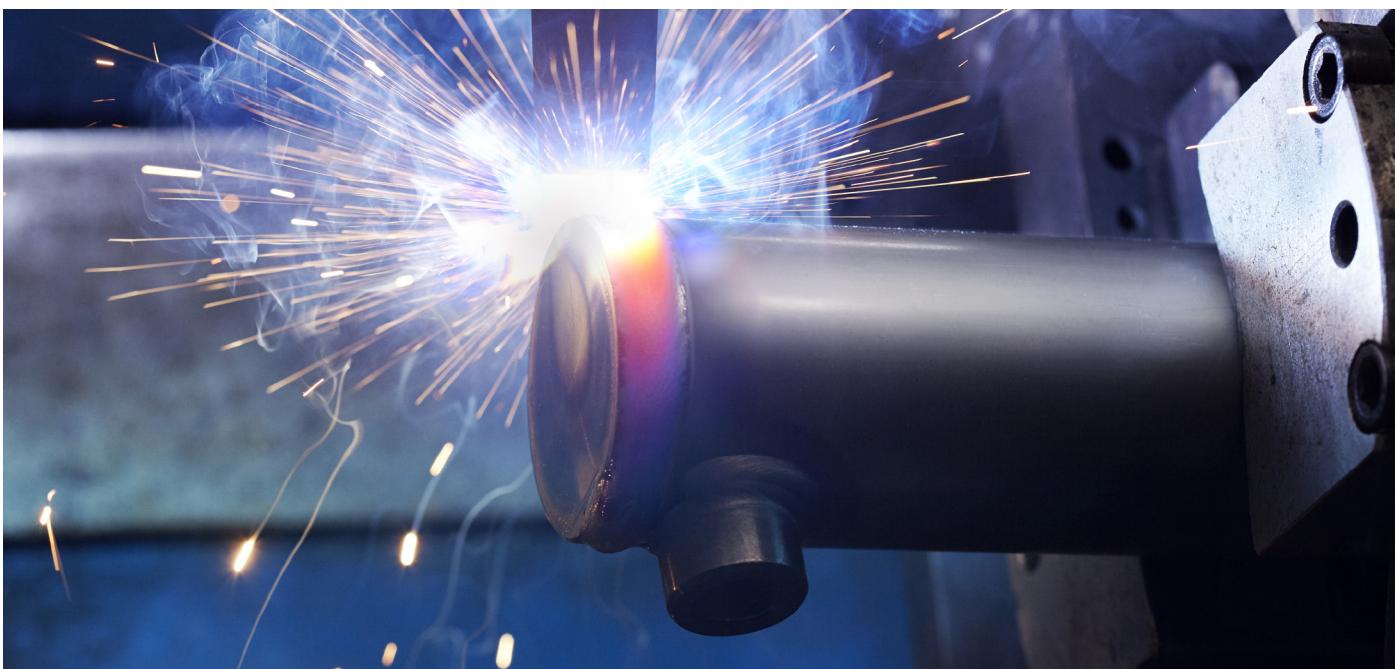

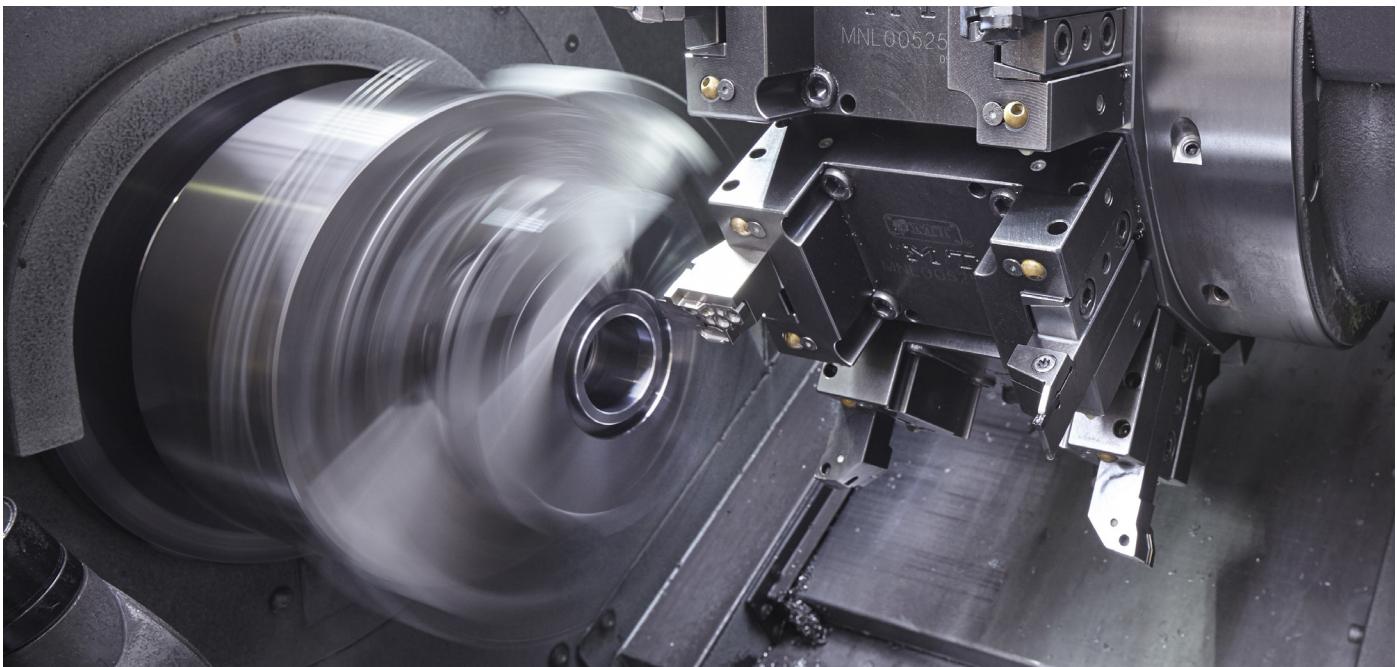

Login at: <http://configuratore.grices.it/>

CUSTOMIZED CYLINDERS

DESIGN AND PRODUCTION

An important part of Grices' production is dedicated to customized cylinders

Grices produces customized cylinders with the possibility to construct cylinders from the client's design or developing projects designed by our technical department on customer's request.

Grices has developed, in 35 years of experience, a know-how in cylinders production for different application sectors with a vast variety of operating conditions, such as temperature, pressure, fluid control, cyclical, lateral stress etc.

We can provide the client with the best solution.

We are able to produce all necessary parts for the cylinders construction in our plant which include the accurate mounting processes and the final tests. This allows us to reach high standards of quality, reliability and enduring product performance.

Technical specifications:

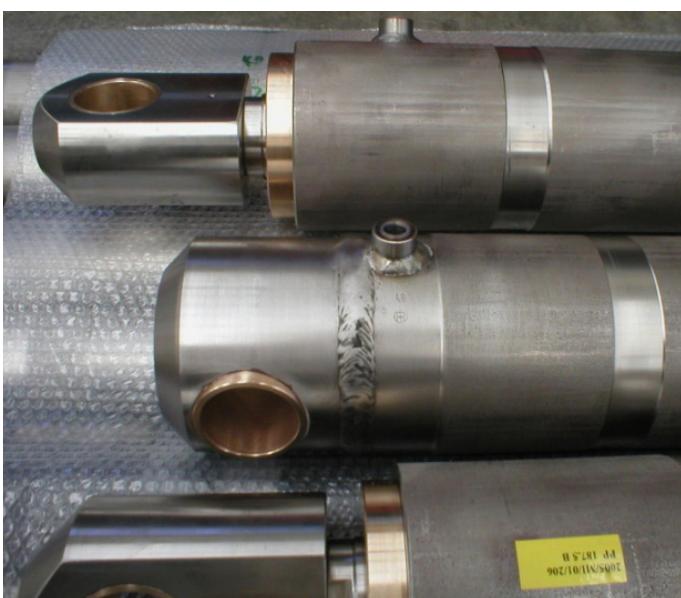

- Maximum pressure 80 MPa
- Bore 400 mm
- Stroke : for single rod up to 4000 mm
- Telescopic stroke up to 12000 mm
- Speed up to 1m/s

Options:

- **Treatments:** chemical nickel plating, thickness chrome plating, nitriding, inducted hardening, cementation, phosphating
- **Painting:** is possible to paint with high thickness paintings in accordance with cycles and client's technical requirements
- **Sensors:** high pressure proximity sensors, adjustable switches with TPN/PNP/REED output
- **Transducers:** internal position transducers with analogue or digital output
- **Round bellows:** in different materials to protect the rod
- **Stroke regulator**
- **Air bleeds/minimess socket**
- **Special seals:** wide range depending on application, fluid and temperature
- Metallic **scrapers**

Certification:

- Structural test with FEM ANALYSIS.
- Standards: ASME, AD2000, GOST, PED.
- Certificates: RI.NA, Lloyd, TUV, Bureau Veritas.

CH CYLINDERS SERIES

STANDARD ISO 6020/2 - 1991 -
DIN 24554 160 BAR COMPACT SERIES

The CH series follows International standards **ISO 6020/2 and DIN 24554**. The compact construction with squared heads and tie rod fits to every kind of industrial application with continuous nominal pressure up to 16 MPa.

The choice of selected materials, the severe controls of 100% of all cylinders produced and the quality of the means of production, allows us to reach high standards of quality, reliability and enduring product performance. The seals used, supplied by premium suppliers, grant high performance and international availability.

The wide range of seals, allows us to offer cylinders for applications with different kinds of hydraulic fluids, speed, frequency and operating temperature.

Our production includes the optional integration of **position transducers** (see *CHT series*) and **adjustable magnetic sensors** (see *CHM series*).

Technical characteristics:

- Standard ISO 6020/2 and DIN 24554.
- Nominal pressure 16 MPa
- Maximum pressure 25 MPa
- Bore: 25-200 mm
- Stroke: up to 4000 mm
- Working temperature from -20°C to +150°C according to the chosen fluid and seals
- Up to 3 rod diameter per bore
- Single or double rod
- 14 Mounting styles Ref. ISO MP1 - MP3 - MS2 - MT1 - MT2 - MT4 - ME5 - ME6 - MP5 - MX6 - MX2 - MX5 - MX3 - MX1
- Wide choice of rod end accessories

Options:

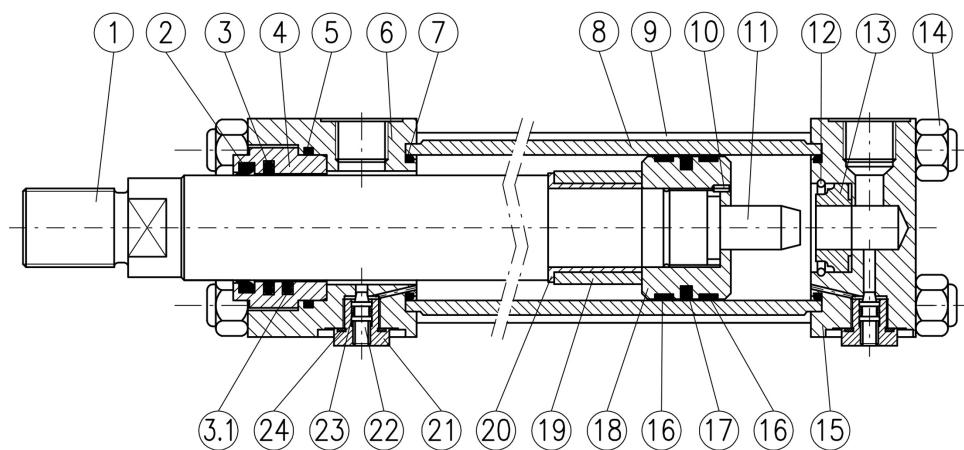

- Fixed or adjustable cushions
- Wide range of seals to suit speed, frequency, temperature and fluid specification
- Proximity sensor integrated in cylinder heads
- Integrated position transducer (see *CHT series*) with analog or digital output
- Adjustable magnetic sensors (see *CHM series*)
- Air bleeds
- Rod treatment : chromed, induction hardened and chromed, nickel-chromed, inox
- Drainage

EPC Cylinder configurator

This is an innovative tool that allows the client to configure CH cylinders in a rapid and intuitive way, guiding the technician through the choices of all the options available.

Once the cylinder code is defined, the EPC software provides 2D, 3D and PDF drawings, and gives the user the possibility to save projects and request offers. With the complete access, reserved to the purchasing department, it is possible to make orders directly. For all orders received through EPC an extra discount will be applied.

Mounting style

TECHNICAL CHARACTERISTICS

STANDARD ISO 6020/2 - 1991 -
DIN 24554 160 BAR COMPACT SERIES

CHOOSING THE PRODUCTION SERIES

In order to identify the production series, make sure that, while the plant is working, the operating pressures indicated for each series are not exceeded. The general dimensioning of the cylinder ensures wide safety margins. Do not exceed the maximum pressure value that corresponds to the test pressure, considering also any overpressure caused by throttle valves in the circuits and/or by vertical loads with downward rods and end of stroke cushioning (see paragraph 1.8).

We recommend to adopt strokes longer by a few millimeters than the working stroke, in order to prevent the use of the cylinder's internal stops as a mechanical end of stroke. Also check that the expected working temperature and speed are consistent with the type of seals installed.

1.1 HYDRAULIC CYLINDERS – SERIES CH

The CH hydraulic cylinders, dimensioned according to standard ISO 6020/2 - DIN 24554, represent the future use of hydraulic actuators;

- Manufactured according to CNC technology, with top-quality materials, they provide maximum reliability and duration.
- The use of standard components during assembly facilitates the replacement of any worn components.
- They can be equipped with progressive cushions of rear and front end of stroke, consisting of self-centering spurs that can slow-down gradually the masses concerned, even of considerable size.
- The seals used are standard, and provide reliability and easy availability on the market.
- The available seals selection fits different speed, frequency, temperature and fluid conditions.

1.2 RANGE OF USE OF CH CYLINDERS

Nominal pressure 16 MPa

Maximal pressure 25 MPa

1.3 CYLINDER BODY

The cylinder body is made up of a top-quality thick steel tube, either cold drawn or hot laminated, with elevated thickness and accurate internal surface (roughness $RA \leq 0.4$ micron, diameter tolerance H8).

The strict quality controls of materials and the precision of manufacturing assure high straightness, concentricity and finishing.

1.4 ROD

Rods are made with top-quality steel and coated with hard chrome. This surface treatment ensures proper protection against any damage and corrosion, favouring the seals' endurance. The minimum surface finish is 0.2 micron.

Rods with strong chrome filling, induction-hardened, inox/chromed or made of special steel, can be manufactured on demand.

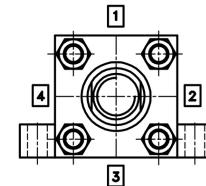

1.5 HEADS

Heads are made of steel and are to ensure perfect concentricity between the cylinder body, the rod bearing and the rod. Wide inner passages are manufactured to minimize any load loss when the fluid is conveyed.

1.6 POSITION OF CONNECTIONS, AIR VENTS AND DAMPING REGULATION

Oil ports and cushioning standard positions are the following:

MOUNTING STYLE		FRONT HEAD Q	REAR HEAD R
TA - TP - AP - FA - FP - CS - CM - CF OI - OA - OP - ZA - ZP	Oil port	1	1
	Cushioning	3	3
PI	Oil port	1	1
	Cushioning	2	2

In order to define all possible combinations of oil ports, cushioning, air bleeds and sensors, refer to the configurator.

Login at: <http://configuratore.grices.it/>

1.7 PISTON

The piston is made with a special material, specially processed to ensure a concentric guide between rod cushioning bushing, cylinder body and head cushioning bushing. A large part of the radial surface is in contact with the cylinder body. This confers considerable stability, so that any rod bending, caused by external radial loads, is minimized.

1.8 END OF STROKE BRAKING

The end of stroke braking is usually adopted on all cylinders working at a speed > 0.1 m/sec., or when loads in vertical direction are activated. This braking is also a safety device in case of failure of servo-systems control equipment. The ratio below makes it possible to promptly calculate, based on the cylinder bore (cushioning section), the supply pressure, the cushioning length and the working speed, as well as the mass that can be cushioned by every single cylinder. This reaction limits the overpressure value to 250 bar, protecting the cylinder's components that are under stress during braking.

$$M = \frac{(p_2 \cdot S - p_1 \cdot A) \cdot 2 \cdot L_f}{V_0^2} \cdot 10^{-2}$$

[kg]

P₁ - supply pressure (bar)

P₂ - maximum pressure 250 (bar)

V₀ - working speed (m/s)

S - cushioning section **S₁** or **S₂** (cm²)

L_f - cushioning length **L_{f1}** or **L_{f2}** (mm)

A - piston area (cm²)

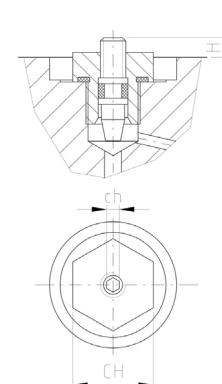

The cushioned mass values obtained from this ratio are simply theoretical, and Grices accepts no responsibility for the use of this ratio. The data to be inserted in the ratio to calculate the mass that can be cushioned may be obtained from the following table.

Bore (mm)	25	32	40	50	63	80	100	125	160	200
S₁ (cm²) rod forward	1,77	3,52	5,50	7,68	13,07	21,98	35,51	51,81	98,94	144,37
S₂ (cm²) rod backward	4,52	6,91	11,43	18,5	29,39	46,45	74,70	118,86	190,79	303,83
L_{f1} (mm) rod forward	19	19	28	29	29	29	31	31	35	38
L_{f2} (mm) rod backward	19	19	28	29	29	29	29	29	40	40
A (cm²)	4,9	8	12,6	19,6	31,2	50,3	78,5	122,7	201,1	314,2

1.9 DAMPING ADJUSTMENT

For a precise cushioning adjustment, both ends of the cylinder are equipped with control valves, equipped a system that prevents their accidental removal. For cylinders with bores 25 - 32, these valves are not available. The table below shows the dimensions and typology of such devices, based on the cylinder bore.

Bore	Hmax (mm)	CH (mm)	ch (mm)
Fixed braking			
40	9	19	3
50	6,5	19	3
63	3,5	19	3
80	3,5	19	3
100	3,5	19	3
125	0	19	3
160	0	19	3
200	0	19	3

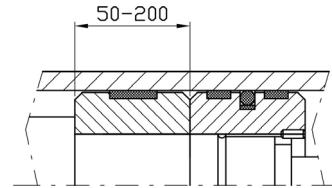

1.10 SPACERS

Cylinders with strokes > 1000mm should be equipped with spacers of adequate design that increase the rod and piston guide, in order to reduce any overload phenomena and premature wear.

The spacer allows to increase the contact surface between piston and cylinder body, improving the system rigidity. The table below indicates the spacer length based on stroke; for the stroke values not included in the table, contact our technicians. As a general rule, spacers are not mounted on cylinders when strokes are < 1000mm and on cylinders subjected to only one pulling action.

STROKE (mm)	1001 a 1500	1501 a 2000	2001 a 2500	2501 a 3000
Spacer symbol	1	2	3	4
Length (mm)	50	100	150	200

1.11 SEALS

The sealing system must be chosen according to the working conditions of the cylinder: speed, fluid type and temperature. Our cylinders feature seals provided with seats conforming to the ISO 7425 norm. That allows our cylinders to work under the heaviest conditions, such as very low or high speed, heavy working, mineral or synthetic fluids. The type of seals to be used in the relevant working conditions are indicated below.

- **TYPE A: (STANDARD)** usually supplied in the absence of particular recommendations, considerable sealing at low pressure, to be used for speeds up to 0.5 m/sec., at temperatures ranging between -20 and +80°C, operation with mineral oil, air, nitrogen.
- **TYPE B: (LOW FRICTION)** anti-friction, not recommended when loads are to be held in position, and recommended at speeds up to 4 m/sec., at temperatures ranging between -20 and +80°C, operation with mineral oil, air, nitrogen.
- **TYPE C: (LOW FRICTION, VITON)** anti-friction, not recommended when loads are to be held in position, and recommended at speeds up to 4 m/sec., at temperatures ranging between -20 and +135°C, operation with phosphoric ester-based fire-retardant fluids.
- **TYPE E: (NBR+PTFE)** anti-friction, not recommended when loads are to be held in position, and recommended at speeds up to 4 m/sec., at temperatures ranging between -20 and +60°C, operation with water-glycol.

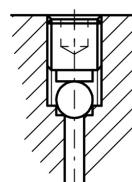

1.12 OIL PORTS

In order to reduce any turbulence and water hammer in the cylinder's connecting pipes as much as possible, we recommend that you ensure that the oil speed does not exceed 6 m/sec. The maximum flow rates that can be obtained with these criteria are shown in the table below.

OIL PORT Ø	1/4"	3/8"	1/2"	3/4"	1"	1 1/4 "
MAX. FLOW RATE (l/mm)	14	28	48	63	102	162

1.13 AIR BLEEDS

Air bleeds are provided on demand on both ends of the cylinder. Bleeds are mounted inside the head and the bottom, so as to be protected from any accidental removal, as shown in the figure on the right. To drain the system, unscrew the nut, discharge the air and close it again, carefully checking its sealing.

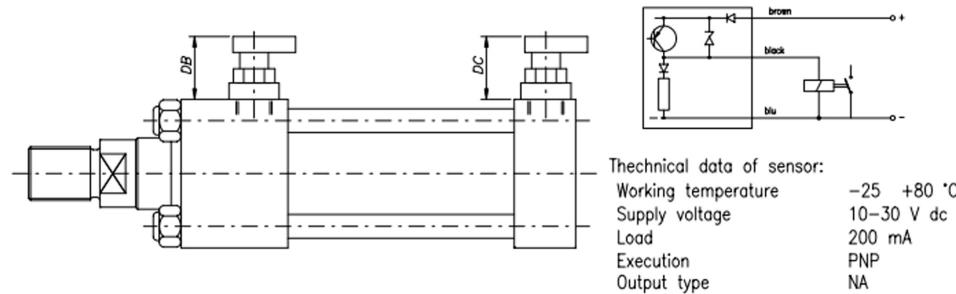

1.14 DRAINAGE

The drainage on the rod seal ensures better sealing at high speed, in particular in cylinders with strokes > 2000mm or in applications where the rod side chamber is constantly under pressure. The drainage port (1/8") is usually positioned on the same axis of the supply port and must be directly connected to the tank.

For any further explanations on this matter, please contact our Technical Department.

1.15 PROXIMITY SENSORS

When the piston position needs to be detected in any hydraulic system, proximity sensors can be mounted directly in the cylinder heads. The operating temperature is -25 to +80°C. Allowed dynamic pressure 350 bar. The sensor is provided with a built-in amplifier, with direct supply (10 to 30Vdc) with an analog PNP output for 200mA max., supplied complete with connector with a 4m long cable. Sensors can be mounted on head and bottom for bores from 40mm up to 200mm, and are arranged on side 2 of the cylinder. With feet mounting (PI), sensors are positioned on side 4. They make it possible to obtain an electric signal near the end of stroke positioning of the piston.

Bore	DB max (mm)	DC max (mm)
40	77	67
50	75	71
63	72	65
80	74	71
100	73	65
125	71	51
160	71	34
200	67	20

Restrictions:

- In OA and FA executions, the sensor is mounted on the head on side 3, facing the supply, and does not allow the mounting of cushioning adjustment;
- In PI execution (bores 40 – 50 – 63), sensors must be removed for fastening the feet's screws and then re-mounted. For all bores in presence of air bleeds they are arranged on the side of the cushioning adjustment;
- In OP and FP executions, the sensor is mounted on the bottom on side 3 facing the supply, and does not allow the mounting of cushioning adjustment;
- For 25 and 32mm bores, the proximity sensors are not provided.

1.16 STROKE TOLERANCE

STROKE	mm	0-500	501-1500	1501-3000	oltre 3000
TOLLERANCE	mm	±1	±2	±3	±4,5

1.17 TIE RODS TORQUE

BORE	mm	25	32	40	50	63	80	100	125	160	200
TIE ROD	mm	M5x0,8	M6x1	M8x1	M12x1,25	M12x1,25	M16X1,5	M16X1,5	M22x1,5	M27x2	M30x2
TORQUE	Nm	4,5-5	7,6-9	19-20,5	68-71	68-71	160-165	160-165	450-455	815-830	1140-1155

2.1 PEAK LOAD

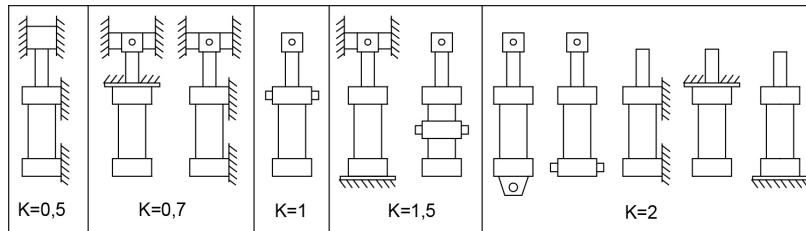

When the cylinder is working under compression, check the rod diameter at peak load. **Table 1** shows the most common types of restriction. Each of them is associated to a coefficient **K**. The maximum stroke of cylinder **L** multiplied by coefficient **K** produces the **LV** value (virtual length, **LV = L*K**). **Graph 2** indicates the rod's minimum diameter, based on load.

The point of intersection between **LV** in mm. and pushing force **F** in **KN** must be below the characteristic curve of the rod to be checked.

Example: cylinder **CH63/28/750/FA/00B** (front flange), that employs a **55 KN** load.

Table 1 shows coefficient **K**, determined by the type of restriction **K = 2**, the virtual length is **LV = L*K** **LV = 750*2 = 1500 mm**.

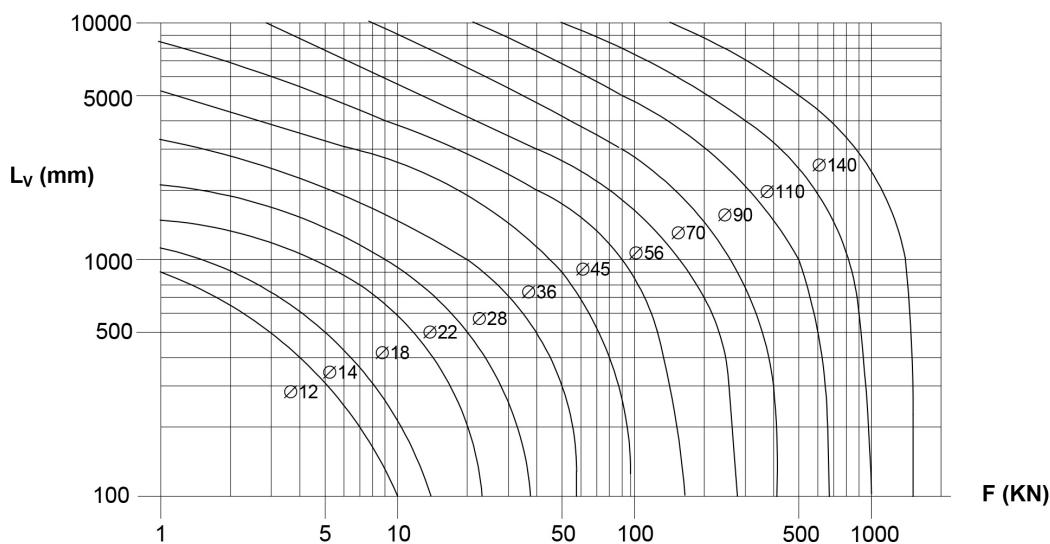

Table 1

In **graph 2** you can check whether the point of intersection between **LV** and **F** is below the curve of rod $\varnothing 28$.

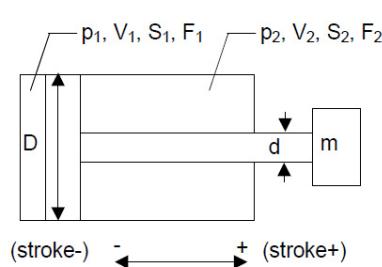

Since the stability condition has not been met, adopt the differential rod $\varnothing 45$. The cylinder **CH63/45/750FA00B** will be therefore selected, which meets the stability condition.

Graph 2

2.2 PRACTICAL UNIT OF MEASUREMENT

DESCRIPTION	SYMBOL	UNIT OF MEASURE
Section	S	cm ²
Pressure	p	bar
\varnothing piston	D	mm
\varnothing rod	d	mm
Speed	V	m/s
Capacity	Q	l/min
Load	m	kg

PUSHING FORCE (STROKE +)
 $F_1 = (p_1 \cdot S_1) \text{ (Kg)}$

PUSHING SPEED (STROKE +)
 $V_1 = Q / (6 \cdot S_1) \text{ (m/s)}$

$$S_1 = \frac{\pi \cdot D^2}{4 \cdot 100} \text{ (cm}^2\text{)}$$

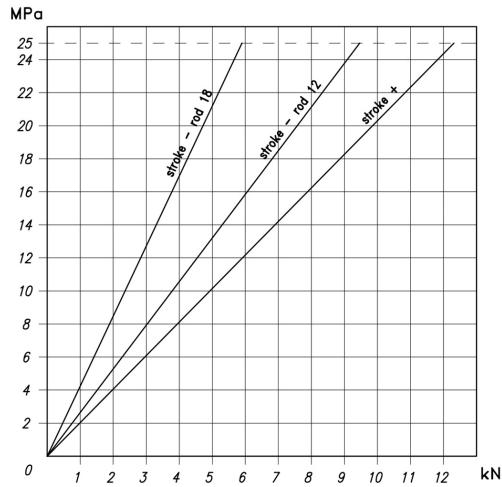

PULLING FORCE (STROKE -)
 $F_2 = (p_2 \cdot S_2) \text{ (Kg)}$

PULLING SPEED (STROKE -)
 $V_2 = Q / (6 \cdot S_2) \text{ (m/s)}$

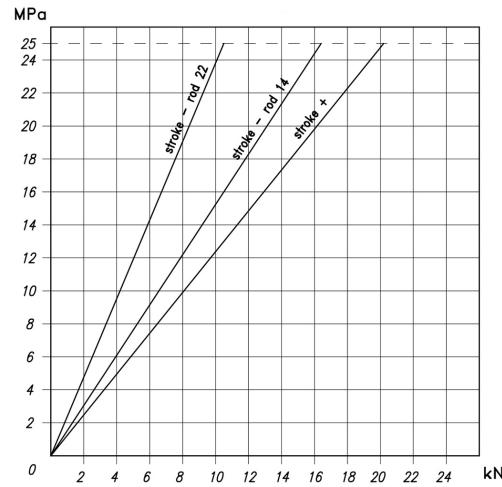

$$S_2 = \frac{\pi \cdot (D^2 - d^2)}{4 \cdot 100} \text{ (cm}^2\text{)}$$

3.1 BUILT-IN PLATES

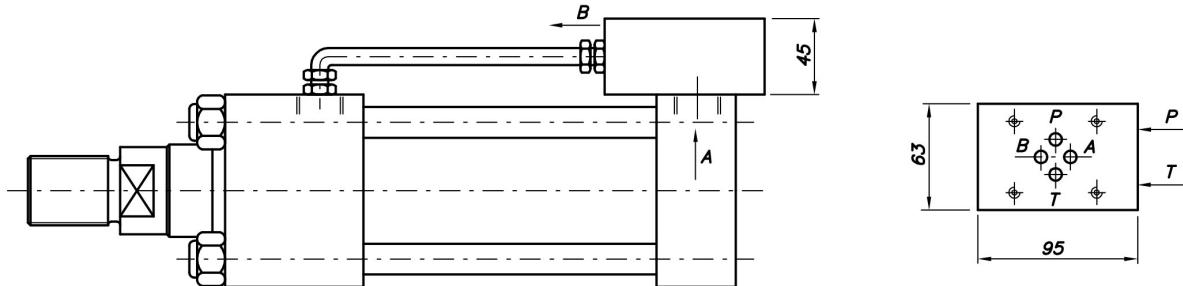

The CH cylinders can be provided with ISO/Cetop plate (03, 05), for mounting the valves directly on the cylinder.

CH cylinder with ISO/Cetop plate 03

- Can be mounted on cylinders with 40 to 200mm bores and minimum stroke 100 mm.
- P and T connections are of 3/8" BSP type.

For further details, contact our Technical Department.

NG03

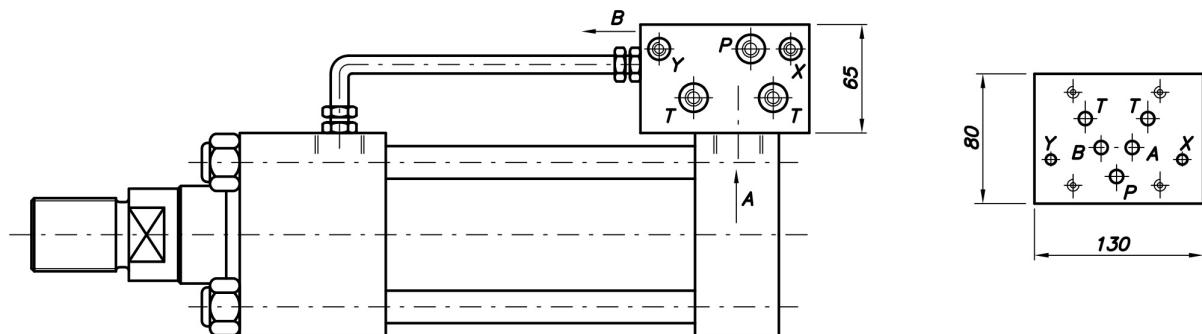

CH cylinder with ISO/Cetop plate 05

- Can be mounted on cylinders with 40 to 200mm bores and minimum stroke 150 mm.
- P and T connections are of 3/4" BSP type, X and Y connections are of 1/4" BSP type.

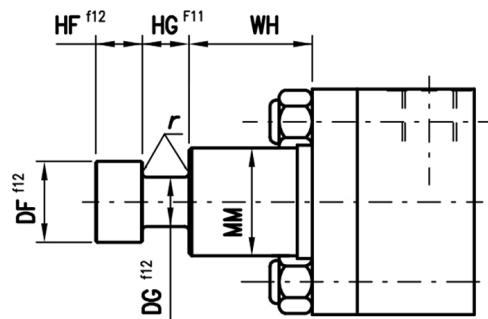

For further details, contact our Technical Department.

*Specify the possible extra-rod (X) size in addition to the standard rod protrusion:

For further information on connections position, air bleeds and standard cushioning adjustment see paragraph 1.6.

Login at: <http://configuratore.grices.it>

Configure your cylinder in a quick and intuitive way choosing all the available options.

Note

The indicated operating pressures are efficient for smooth applications without blows. For extreme loads or high operating pressures with high frequency, it is necessary to use mounting styles and thread-rod links designed to be stress-resistant. In double-rod cylinders, the main rod is screwed directly into the piston while the rod n.2, directly to the main rod. The mechanical strength is therefore lower than that of the main rod. The use of the rod n.2 is mainly recommended for balancing the thrust and traction areas.

For further information contact our Technical Department.

CHT CYLINDERS SERIES

STANDARD ISO 6020/2 - 1991 -
DIN 24554 160 BAR COMPACT SERIES

CHT series integrates **magnetostrictive transducers** that allows to keep track of the rod position. This series is designed to guarantee maximum reliability, high performance and endurance.

The integrated transducer and the technology used, assure precision and lack of friction, as the parts in movement are not in contact with each other.

These characteristics allow the cylinder to operate in heavy working environments, protected from dirt and shock, ensuring maximum reliability of the system and reducing the need of maintenance to a minimum. Transducers can be supplied with analogue, digital or IO/LINK output.

The compact construction that follows **ISO 6020/2 and DIN 24554** standards , with squared heads and tie rods, suits every kind of industrial application with compact dimensions and continuous nominal pressure up to 16 MPa. The choice of selected materials, the severe controls of 100% of all cylinders produced and the quality of the means of production, allow Grices to reach high standards of quality, reliability and enduring product performance.

The seals used, supplied by premium suppliers, grant high performance and international availability.

The wide range of seals, allows us to offer cylinders for applications with different kinds of hydraulic fluids, speed, frequency and operating temperature.

Technical specifications:

- Standard ISO 6020/2 and DIN 24554 mounting styles.
- Magnetostrictive position transducer integrated with analogue output signal (intensity or tension) or digital output signal (SSI, CAN-open, PROFIBUS-DP or IO/LINK)
- Nominal pressure 16 MPa
- Maximum pressure 25 MPa
- Bore 40-200 mm
- Stroke: up to 4000 mm
- Up to 3 rod diameter per bore
- 10 Mounting styles Ref. ISO MP1 - MP3 - MS2 - MT1 - MT2 - MT4 - ME5 - MP5 - MX3 - MX5

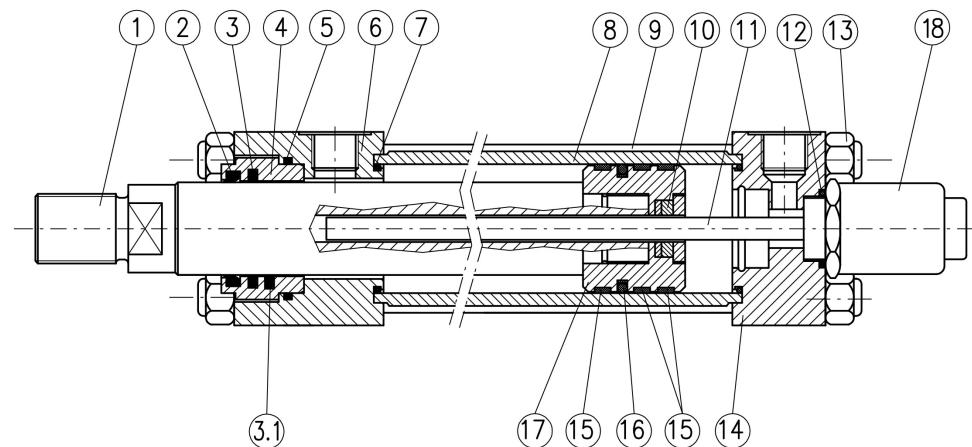

Options:

- Analogue output signal: 4/20 mA or 0/10 V
- Digital output signal: SSI, CAN-open, PROFIBUS-DP, IO/LINK
- Front cushioning
- Air bleeds
- Rod treatment : chromed, induction hardened and chromed, nickel-chromed
- Drainage
- Subplate CETOP 03/05
- Protective case

EPC Cylinder configurator

This is an innovative tool that allows the client to configure CHT cylinders in a rapid and intuitive way, guiding the technician through the choices of all the options available. Once the cylinder code is defined, the EPC software provides 2D, 3D and PDF drawings, and gives the user the possibility to save projects and request offers. With the complete access, reserved to the purchasing department, it is possible to make orders directly. For all orders received through EPC an extra discount will be applied.

LINEAR POSITION TRANSDUCERS

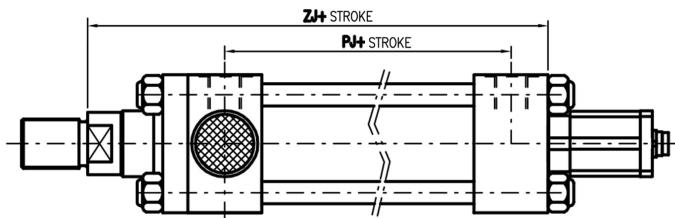

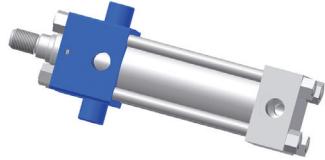

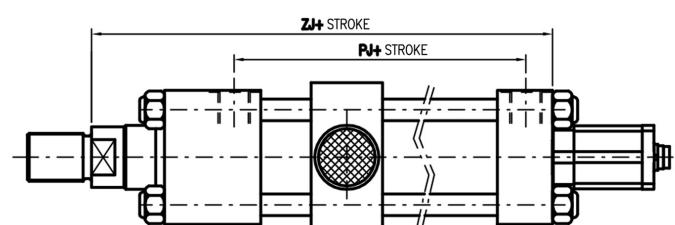

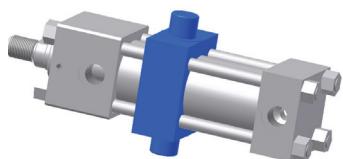

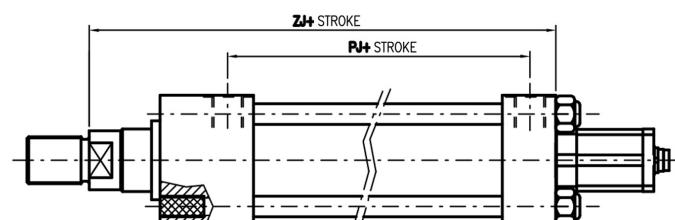

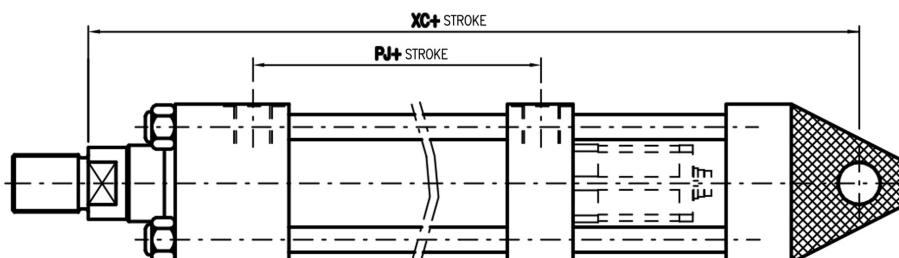

To immediately check the rod position, install a linear position transducer.

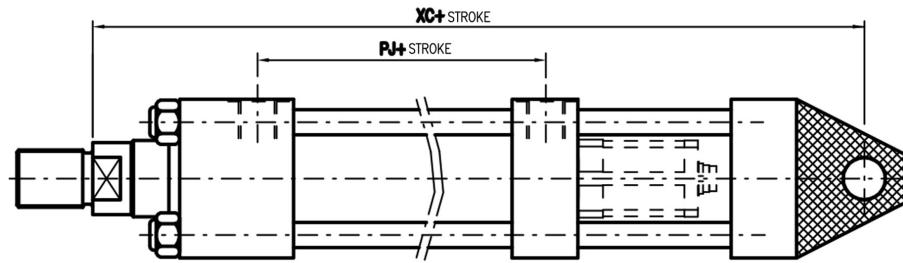

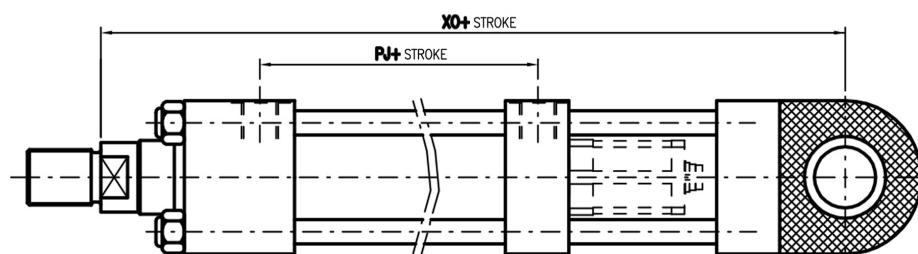

The magnetostrictive technology allows to detect the rod position even in heavy duty conditions and/or high frequency applications, avoiding the contact between the moving parts.

The transducer, in addition to offering a high reliability, permits easy maintenance. Analogue or digital versions are available.

Resolution	0,01 mm
Independent linearity	±0,05 % (% of the total stroke)
Repeatability	±0,01 % (% of the total stroke)
Max. speed	2 m/sec
Working temperature	-20 +80 °C
Analogue/digital signal	0+10 V 10+0 V or 4+20 mA / SSI, CAN OPEN, PROFIBUS DP, IO/LINK
Strokes	50÷3850 mm
Max. transducer pressure	35 MPa (350 Bar)
Power supply	24 V DC ±10 %
Protection degree (connector installed)	IP-67

CHM CYLINDERS SERIES

STANDARD ISO 6020/2 - 1991 -
DIN 24454 160 BAR COMPACT SERIES

CHM cylinder series, with **adjustable proximity sensors**, derives from the CH series and follows international standards **ISO 6020/2 and DIN 24554**. The compact construction with squared heads and tie rod fits to every kind of industrial application with continuous nominal pressure up to **12 MPa**.

The tube in stainless steel and the piston with integrated permanent magnet allows the sensor to detect the rod position. These sensors can be used to execute sequences of cycles or to set the desired position. The sensors are mounted with adjustable brackets on the tie rods and can be positioned along all cylinder stroke. As the sensors detect the integrated permanent magnet of the piston, the commutation of the electrical circuit occurs.

The sensor available is: **KPN** type, electronic with high sensitivity and infinite electronic life, with 3 circuit cables.

The choice of selected materials, the severe controls of 100% of all cylinders produced and the quality of the means of production, allow us to reach high standards of quality, reliability and enduring product performance. The seals used, supplied by premium suppliers, grant high performance and international availability. The wide range of seals, allows us to offer cylinders for applications with different kinds of hydraulic fluids, speed, frequency and operating temperature.

Technical specifications:

- Standard ISO 6020/2 and DIN 24554.
- Adjustable proximity sensors type KPN "Hall effect" IP67
- Nominal pressure 12 MPa
- Maximum pressure 16 MPa
- Bore 25-100 mm
- Stroke up to 4000 mm
- Single or double rod
- Up to 3 rod diameter per bore
- 13 Mounting styles Ref. ISO MP1 - MP3 - MS2 - MT1 - MT2 - ME5 - ME6 - MP5 - MX6 - MX2 - MX5 - MX3 - MX1

Options:

- Fixed or adjustable cushionings
- Air bleeds
- Rod treatment : chromed, induction hardened and chromed, nickel-chromed
- Drainage

EPC Cylinder configurator

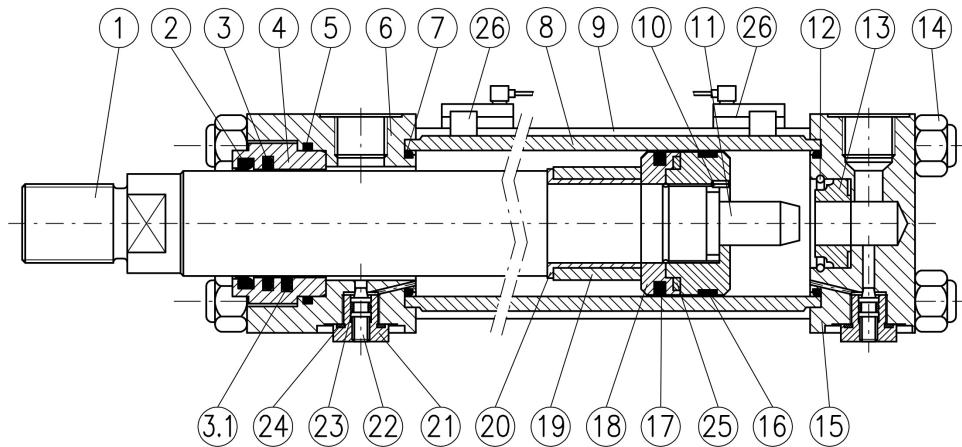

This is an innovative tool that allows the client to configure CHM cylinders in a rapid and intuitive way, guiding the technician through the choices of all the options available.

Once the cylinder code is defined, the EPC software provides 2D, 3D and PDF drawings, and gives the user the possibility to save projects and request offers.

With the complete access, reserved to the purchasing department, it is possible to make orders directly.

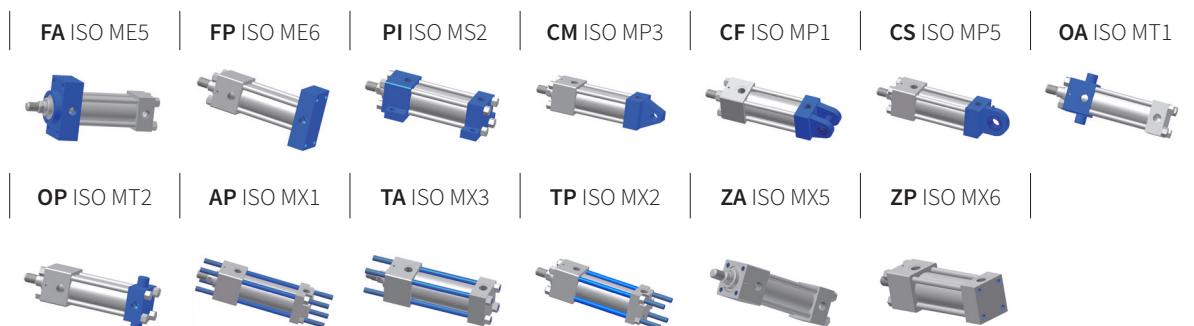

For all orders received through EPC an extra discount will be applied.

DIN 24454 160 BAR COMPACT SERIES

ADJUSTABLE POSITION SENSORS

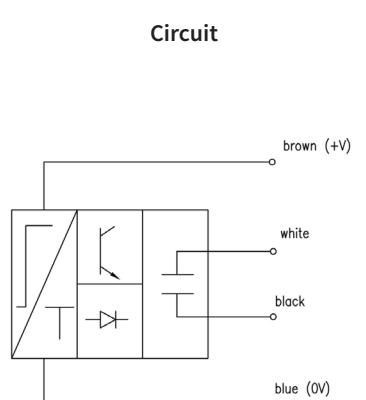

The sensors mounted on the cylinder body and detect the presence of the magnetic field created by the magnet inside the cylinder. The sensor is a switch and accordingly must be always mounted in series to a load (of inductive, resistive or capacitive type), without exceeding the limits of its electrical characteristics. The LED sensors work at a minimum voltage of 20V, because of their display circuit. Sensors are provided with 3 m long cable. The sensor dimensions are indicated in the table below, and must be added to dimensions specified for series CH.

Bore	25	32	40	50	63	80	100

AVAILABLE MODELS

The OI execution is not available. Any other execution is manufactured with 25 to 100mm bore.

SENSOR INSTALLATION

When the sensors are located near the cylinder heads (< 15mm), magnetic interference can occur, caused by the magnetic field generated by the piston magnet and cylinder heads. This can cause difficulties in sensors commutation. For further information contact our Technical Department.

*Specify the possible extra-rod (X) size in addition to the standard rod protrusion:

Login at: <http://configuratore.grices.it/>

Configure your cylinder in a quick and intuitive way choosing all the available options.

Note

The indicated operating pressures are efficient for smooth applications without blows. For extreme loads or high operating pressures with high frequency, it is necessary to use mounting styles and thread-rod links designed to be stress-resistant.

In double-rod cylinders, the main rod is screwed directly into the piston while the rod n.2, directly to the main rod. The mechanical strength is therefore lower than that of the main rod. The use of the rod n.2 is mainly recommended for balancing the thrust and traction areas.

For further information contact our Technical Department.

CA CYLINDERS SERIES

STANDARD ISO 6020/1

CA cylinders series follows international standard **ISO 6020/1**. The compact construction with round head fits to the most demanding and challenging industrial actuation requests with continuous nominal pressure up to **16 MPa**.

The choice of selected materials, the severe controls of 100% of all cylinders produced and the quality of the means of production, allow us to reach high standards of quality, reliability and enduring product performance.

The seals used, supplied by premium suppliers, grant high performance and international availability. The wide range of seals, allows us to offer cylinders for applications with different kinds of hydraulic fluids, speed, frequency and operating temperature. Our production includes the optional integration of position transducers (see *CAT series*).

Technical characteristics:

- Standard ISO 6020/1
- Nominal pressure 16 MPa
- Maximum pressure 25 MPa
- Bore 40-320 mm
- Stroke up to 4000 mm
- Single or double rod
- Up to 2 rod diameter per bore
- 8 Mounting styles Ref. ISO MP3 - MF4 - MF3 - MS2 - MT4 - MF1 - MF2 - MP5
- Wide range of accessories for rod end and mounting styles

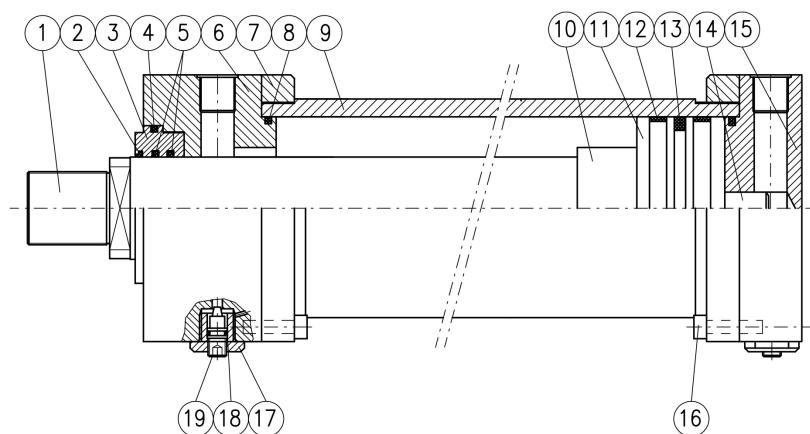

Options:

- Fixed or adjustable cushionings
- Wide range of seals to suit speed, frequency, temperature and fluid specification
- Proximity sensor integrated in cylinder heads
- Magnetostrictive position transducer integrated with analogue output signal (intensity or tension) or digital output signal (SSI, CAN-open, PRODIFUB-DP or IO/LINK) (see *CAT series*)
- Air bleeds
- Rod treatment : chromed, induction hardened and chromed, nickel-chromed, inox
- Subplate CETOP 03/05
- Drainage

Configuratore EPC

This is an innovative tool that allows the client to configure CA cylinders in a rapid and intuitive way, guiding the technician through the choices of all the options available.
Once the cylinder code is defined, the EPC software provides 2D, 3D and PDF drawings, and gives the user the possibility to save projects and request offers. With the complete access, reserved to the purchasing department, it is possible to make orders directly. For all orders received through EPC an extra discount will be applied.

TECHNICAL CHARACTERISTICS

STANDARD ISO 6020/1

CHOOSING THE PRODUCTION SERIES

In order to identify the production series ensure that while the plant is working, the operating pressures indicated for each series are not exceeded. The general dimensioning of the cylinder ensures wide safety margins. Do not exceed the maximum pressure value that corresponds to the test pressure, considering also any overpressure caused by throttle valves in the circuits and/or by vertical loads with downward rods and end of stroke cushioning (see paragraph 1.7).

We recommend adopting strokes longer by a few millimetres than the working stroke, in order to prevent the use of the use of the cylinder's internal stops as a mechanical end of stroke. Also check that the expected working temperature and speed are consistent with the type of seals installed.

1.1 HYDRAULIC CYLINDERS – SERIES CA

The CA hydraulic cylinders are dimensioned according to standard ISO 6020/1;

- Manufactured according to CNC technology, with top-quality materials, they provide maximum reliability and duration.
- The use of standard components during assembly facilitates the replacement of any worn components.
- They can be equipped with progressive cushions of rear and front end of stroke, consisting of self-centering spurs that can slow-down gradually the masses concerned, even of considerable size.
- The seals used are standard, and provide reliability and easy availability on the market. The available seals selection fits different speed, frequency, temperature and fluid conditions

1.2 RANGE OF USE OF CA CYLINDER

Nominal pressure 16 Mpa

Maximal pressure 25 Mpa

1.3 CYLINDER BODY

The cylinder body is made up of a top-quality thick steel tube, either cold drawn or hot laminated, with elevated thickness and accurate internal surface (roughness $RA \leq 0.4$ micron, diameter tolerance H8).

1.4 ROD

Rods are made with top-quality steel and coated with hard chrome. This surface treatment ensures proper protection against any damage and corrosion, favouring the seals' endurance. The minimum surface finish is 0.2 micron. Rods with strong chrome filling, induction-hardened, inox/chromed or made of special steel, can be manufactured on demand.

1.5 HEAD

Heads are made of steel and are manufactured to ensure perfect concentricity between the cylinder body, the rod bearing and the rod. Wide inner passages are manufactured to minimize any load loss when the fluid is conveyed.

1.6 PISTON

The piston is made with a special material, specially processed to ensure a concentric guide between rod cushioning sleeve, cylinder body and head cushioning sleeve. A large part of the radial surface is in contact with the cylinder body. This confers considerable stability, so that any rod bending, caused by external radial loads, is minimized.

1.7 END OF STROKE CUSHIONING

The end of stroke cushioning is usually adopted on all cylinders working at a speed > 0.1 m/sec., or when loads in vertical direction are activated. This cushioning is also a safety device in case of servo-systems control equipment failure. The ratio below makes it possible to promptly calculate, based on the cylinder bore (cushioning section), the supply pressure, the cushioning length and the working speed, as well as the mass that can be cushioned by every single cylinder. This reaction limits the overpressure value to 250 bar, protecting the cylinder's components that are under stress during braking.

$$M = \frac{(p_2 \cdot S - p_1 \cdot A) \cdot 2 \cdot L_f}{V_0^2} \cdot 10^{-2}$$

[kg]

- P₁** - supply pressure (bar)
- P₂** - maximum pressure 250 (bar)
- V₀** - working speed (m/s)
- S** - cushioning section **S₁** or **S₂** (cm²)
- L_f** - cushioning length **L_{f1}** or **L_{f2}** (mm)
- A** - piston area (cm²)

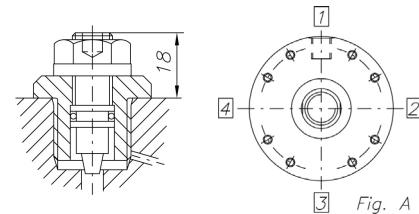

The cushioned mass values obtained from this ratio are simply theoretical, and Grices accepts no responsibility for the use of this ratio. The data to be inserted in the ratio to calculate the mass that can be cushioned may be obtained from the following table.

Bore (mm)	40	50	63	80	100	125	160	200	250	320
S₁ (cm ²) rod forward	5,5	8,2	13,8	23,8	37,8	56	102	151	177	352
S₂ (cm ²) rod backward	11,4	18,5	29,1	46,4	73,2	114	189	294	471	748
L_f (mm)	28	30	30	30	32	32	40	46	95	100
A (cm ²)	17,6	19,6	31,2	50,3	78,5	122,7	201,1	314,2	490,6	803,8

The standard cushioning is in position 3 (figure A); it is possible to request a different cushioning position.

1.8 CUSHIONING ADJUSTMENT

For a precise cushioning adjustment, both ends of the cylinder are equipped with control valves, as shown in figure on the right. These devices are equipped with a system that prevents their accidental removal. These devices are located on side 3.

1.9 SPACERS

Cylinders with strokes > 1000mm should be equipped with spacers of adequate design that increase the rod and piston guide, in order to reduce any overload phenomena and premature wear.

The spacer allows increase of the contact surface between piston and cylinder body, improving the system rigidity. The table below indicates the spacer length based on stroke; for the stroke values not included in the table, contact our technicians. As a general rule, spacers are not mounted on cylinders when strokes are < 1000mm and on cylinders subjected to only one pulling action.

STROKE (mm)	1001 a 1500	1501 a 2000	2001 a 2500	2501 a 3000
Spacer symbol	1	2	3	4
Length (mm)	50	100	150	200

1.10 SEALS

On the basis of particular working conditions of the cylinders, such as speed, fluid used and temperature, the relevant seal shall be chosen in conformity with the manufacturer's recommendations.

Our cylinders feature low-friction seals with seats conforming to the provisions of ISO 7425, that allow our cylinders to work under the heaviest conditions, such as very low or high speed, high working frequency, mineral or synthetic fluids. The type of seals to be used in the relevant working conditions are indicated below:

- **TYPE A: (STANDARD)** usually supplied in the absence of particular recommendations, considerable sealing at low pressure, to be used for speeds up to 0.5 m/sec., at temperatures ranging between -20 and +80°C, operation with mineral oil, air, nitrogen.
- **TYPE B: (NITRILE+PTFE)** anti-friction, not recommended when loads are to be held in position, and recommended at speeds ≤ 4 m/sec., at temperatures ranging between -10 and +75°C, operation with mineral oil or glycol water.
- **TYPE C: (VITON+PTFE)** anti-friction, not recommended when loads are to be held in position, for high-temperature fluids, up to +135°C, maximum speed 4m/sec. Can be used also with phosphoric esters.

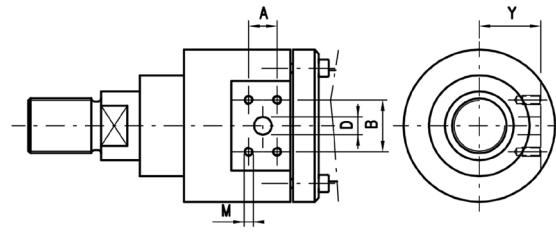

1.11 OIL PORTS

Oil ports are BSP threaded, with boring conforming to DIN 3852/2, standard position 1 in figure A; other alternative positions can be provided on demand. Optional presetting for mounting SAE 6000 flanges (*contact our Technical Department*).

In order to reduce as much as possible any turbulence and water hammer in the cylinder's connecting pipes, the oil speed does not exceed 6 m/sec. The maximum flow rates that can be obtained with these criteria are shown in the table below.

OIL PORT Ø	1/2"	3/4"	1"	1 1/4"	1 1/2"
MAX. FLOW RATE (l/mm)	40	53	85	136	212

BORE	FLANGE SAE 3000				
	Flange DN	Y	A	B	D
100	19	71	22,2	47,6	19
125		89			
160	25	110	26,2	52,4	25 M10x1,5
200		137			
250	32	177	30,2	58,7	32
320		220			

1.12 AIR BLEEDS

Air bleeds are provided on demand on both ends of the cylinder. Bleeds are mounted inside the head and the bottom, so as to be protected from any accidental removal, as shown in the figure on the right.

Standard position: 2 in figure A; other alternative positions can be provided on demand.

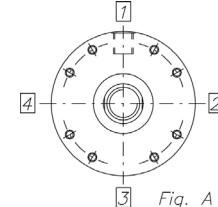

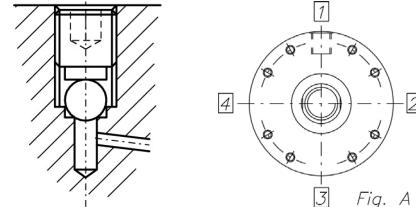

Fig. A

1.14 DRAINAGE

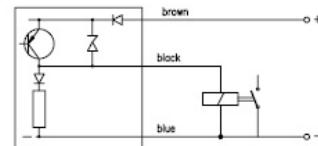

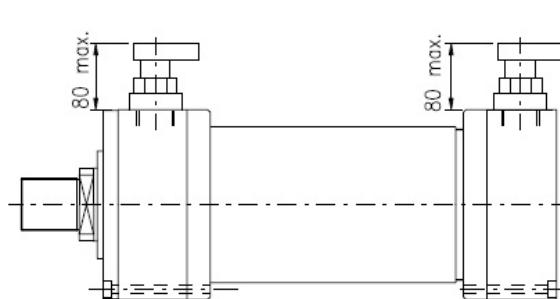

The drainage on the rod seal ensures better sealing at high speed, in particular in cylinders with strokes > 2000mm or in applications where the rod side chamber is constantly under pressure. The drainage port (1/8") is usually positioned on the same axis of the supply port and must be directly connected to the tank.

For any further explanations on this matter, please contact our Technical Department.

1.14 PROXIMITY SENSORS

When the piston position needs to be detected in any hydraulic system, proximity sensors can be mounted directly in the cylinder heads. The operating temperature is -25 to +80°C. Allowed dynamic pressure 350 bar.

The sensor is provided with a built-in amplifier, with direct supply (10 to 30Vdc) with an analog PNP output for 200mA max., supplied complete with connector with a 4m long cable. Sensors can be mounted on head and bottom, and are arranged on side 4 of the cylinder. It is possible to request a different positioning. Sensors offer the possibility to obtain an electric signal near the end of stroke positioning of the piston.

Technical data of the sensor:

Working temperature	-25 +80 °C
Supply voltage	10-30 V cc
Load	200 mA
Execution	PNP
Output type	NA

BORES	DB max (mm)	Dcmax (mm)
40	81	72
50	77	65
63	72	55
80	70	51
100	63	52
125	57	35
160	44	22
200	51	0
250	32	0
320	10	0

For a definition of all possible combinations of placement of power supplies, cushioning, air bleeds and sensors, refer to the configurator.

TORQUE	Nm	6	12	23	22	60	100	100	260	500	640

2.1 PEAK LOAD

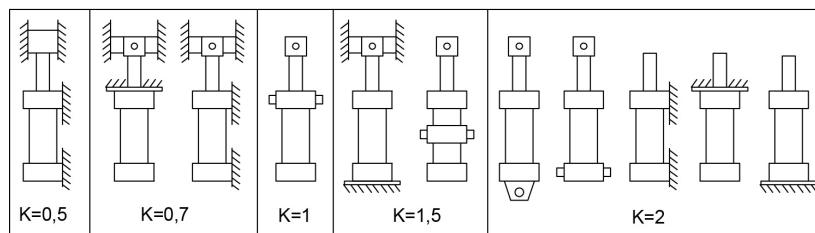

When the cylinder is working under compression, check the rod diameter at peak load. **Table 1** shows the most common types of restriction. Each of them is associated to a coefficient **K**. The maximum stroke of cylinder **L** multiplied by coefficient **K** produces the **LV** value (virtual length, $LV = L \cdot K$). **Graph 2** indicates the rod's minimum diameter, based on load.

The point of intersection between **LV** in mm. and pushing force **F** in **kN** must be below the characteristic curve of the rod to be checked.

Example: cylinder **CA63/28/750/FA/00B** (front flange) employs a **55 KN** load.

Table 1 shows coefficient **K**, determined by the type of restriction **K = 2**, the virtual length is **LV = L*K** **LV = 750*2 = 1500 mm**.

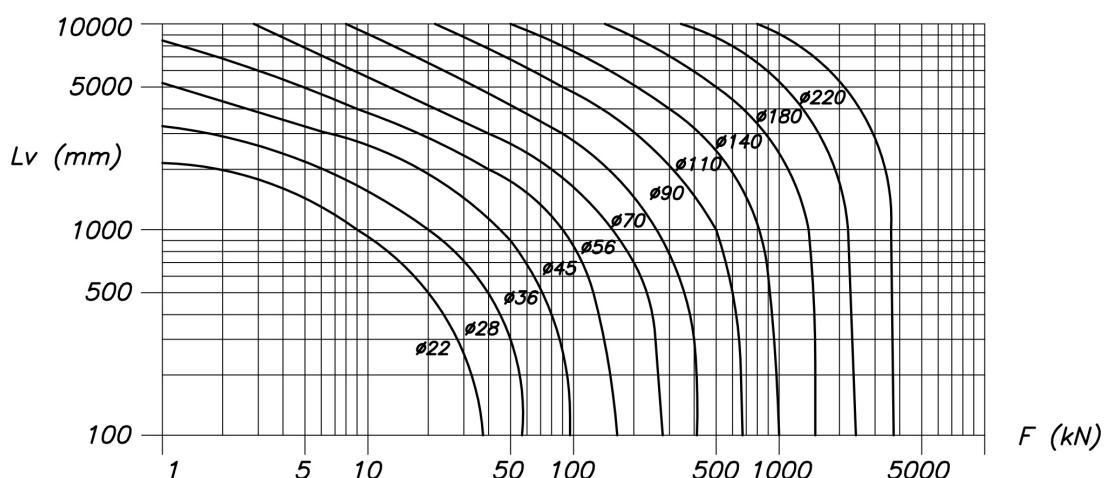

Table 1

In **graph 2** you can check whether the point of intersection between **LV** and **F** is below the curve of rod $\varnothing 45$.

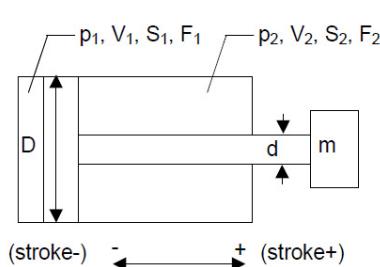

Once the stability condition has been met the rod $\varnothing 45$ can be adopted. If the result was negative (intersection point of **LV** and **F** over the curve) you should choose a cylinder with a larger rod.

Graph 2

2.2 PRACTICAL UNIT OF MEASUREMENT

DESCRIPTION	SYMBOL	UNIT OF MEASURE
Section	S	cm ²
Pressure	p	bar
\varnothing piston	D	mm
\varnothing rod	d	mm
Speed	V	m/s
Capacity	Q	l/min
Load	m	kg

PUSHING FORCE (STROKE +)

$$F_1 = (p_1 \cdot S_1) \text{ (Kg)}$$

PUSHING SPEED (STROKE +)

$$V_1 = Q / (6 \cdot S_1) \text{ (m/s)}$$

$$S_1 = \frac{\pi \cdot D^2}{4 \cdot 100} \text{ (cm}^2\text{)}$$

PULLING FORCE (STROKE -)

$$F_2 = (p_2 \cdot S_2) \text{ (Kg)}$$

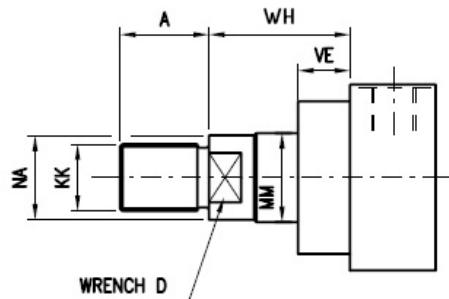

PULLING SPEED (STROKE -)

$$V_2 = Q / (6 \cdot S_2) \text{ (m/s)}$$

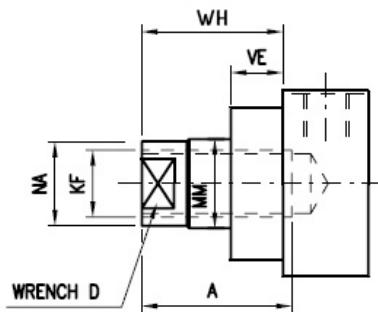

$$S_2 = \frac{\pi \cdot (D^2 - d^2)}{4 \cdot 100} \text{ (cm}^2\text{)}$$

Login at: <http://configuratore.grices.it/>

Configure your cylinder in a quick and intuitive way choosing all the available options.

Note

The indicated operating pressures are efficient for smooth applications without blows. For extreme loads or high operating pressures with high frequency, it is necessary to use mounting styles and thread-rod links designed to be stress-resistant.

For further information contact our Technical Department.

CAT CYLINDERS SERIES

STANDARD ISO 6020/1

CAT series integrates **magnetostrictive transducers** and follows international standard ISO 6020/1; this series is designed to guarantee maximum reliability, high performance and endurance.

The compact construction with round heads fits to the most demanding and challenging industrial actuation requests with continuous nominal pressure up to **16 MPa**.

The integrated transducer and the used technology, assure precision and lack of wear, as the parts in movement are not in contact with each other.

These characteristics allow the cylinder to operate in heavy working environments, protected from dirt and shock, ensuring maximum reliability of the system and reducing the need of maintenance to a minimum. Transducers can be supplied with analogue or digital output.

The choice of selected materials, the severe controls of 100% of all cylinders produced and the quality of the means of production, allow to reach high standards of quality, reliability and enduring product performance.

The seals used, supplied by premium suppliers, grant high performance and international availability. The wide range of seals, allows us to offer cylinders for applications with different kinds of hydraulic fluids, speed, frequency and operating temperature.

Technical characteristics:

- Standard ISO 6020/1
- Magnetostrictive position transducer integrated with analogue output signal (intensity or tension) or digital output signal (SSI, CAN-open, PROFIBUS-DP or IO/LINK)
- Nominal pressure 16 MPa
- Maximum pressure 25 MPa
- Bore 40-320 mm
- Stroke up to 4000 mm
- Single or double rod
- Up to 2 rod diameter per bore
- 6 Mounting styles Ref. ISO MP3 - MF3 - MS2 - MT4 - MF1 - MP5

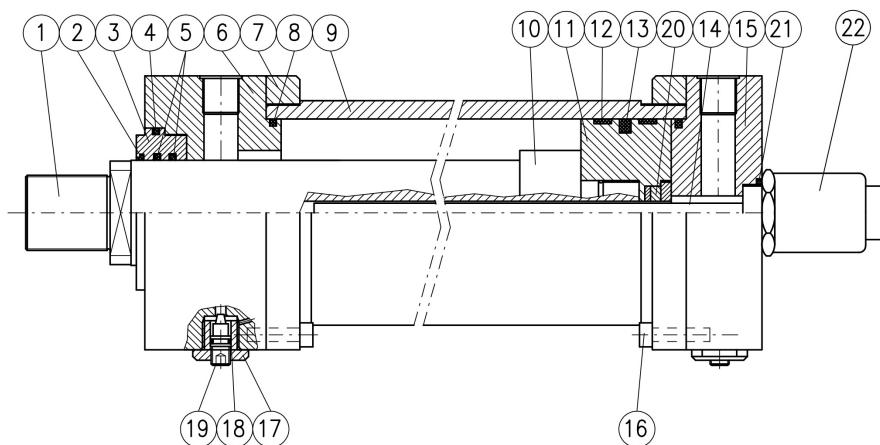

Options:

- Analogue output signal: 4/20 mA or 0/10 V
- Digital output signal: SSI, CAN-open, PROFIBUS-DP, IO/LINK
- Air bleeds
- Rod treatment : chromed, induction hardened and chromed, nickel-chromed
- Drainage
- Subplate CETOP 03/05
- Protection case

EPC Cylinder configurator

This is an innovative tool that allows the client to configure CAT cylinders in a rapid and intuitive way, guiding the technician through the choices of all the options available. Once the cylinder code is defined, the EPC software provides 2D, 3D and PDF drawings, and gives the user the possibility to save projects and request offers. With the complete access, reserved to the purchasing department, it is possible to make orders directly. For all orders received through EPC an extra discount will be applied.

TECHNICAL CHARACTERISTICS

STANDARD ISO 6020/1

LINEAR POSITION TRANSDUCER

To immediately check the rod position, install a linear position transducer.

The magnetostrictive technology allows rod position detection even in heavy duty conditions and/or high frequency applications, avoiding the contact between the moving parts.

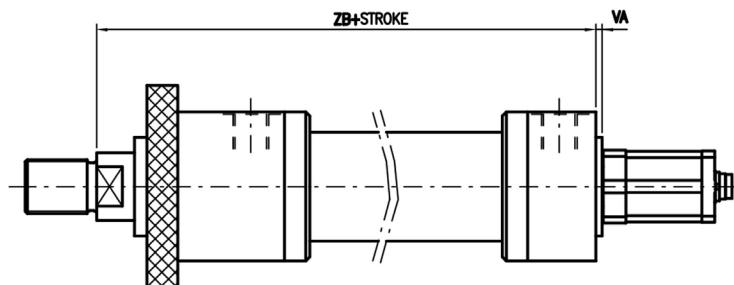

The transducer, besides offering a high reliability, permits easy maintenance. Its replacement does not require the cylinder dismounting.

Analogue or digital versions are available.

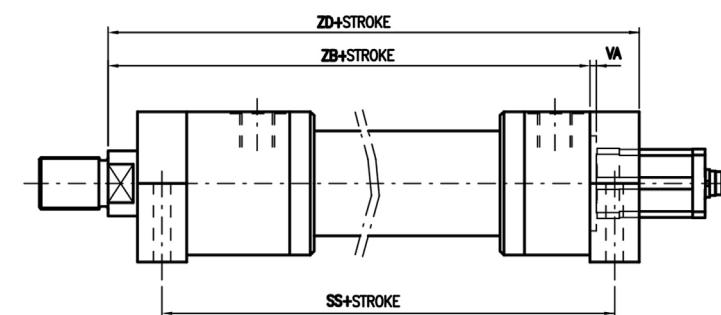

Resolution	0,01 mm
Independent linearity	±0,05 % (% of the total stroke)
Repeatability	±0,01 % (% of the total stroke)
Max. speed	2 m/sec
Working temperature	-20 +80 °C
Analogue/digital signal	0+10 V 10+0 V or 4+20 mA / SSI, CAN OPEN, PROFIBUS DP, IO/LINK
Strokes	50÷3850 mm
Max. transducer pressure	35 MPa (350 Bar)
Power supply	24 V DC ±10 %
Protection degree (connector installed)	IP-67

Login at: <http://configuratore.grices.it/>

Configure your cylinder in a quick and intuitive way choosing all the available options.

Note

The indicated operating pressures are efficient for smooth applications without blows. For extreme loads or high operating pressures with high frequency, it is necessary to use mounting styles and thread-rod links designed to be stress-resistant.

For further information contact our Technical Department.

CC CYLINDERS SERIES

STANDARD ISO 6022

CC cylinders series follows International standards **ISO 6022 and DIN 24333**.

The construction with round heads fits to the most demanding and challenging industrial actuation requests in the iron and steel industry, with continuous nominal pressure up to **25 MPa**. The choice of selected materials, the severe controls of 100% of all cylinders produced and the quality of the means of production, allows us to reach high standards of quality, reliability and enduring product performance.

The seals used, supplied by premium suppliers, grant high performance and international availability. The wide range of seals, allows us to offer cylinders for applications with different kinds of hydraulic fluids, speed, frequency and operating temperature. Our production includes the optional integration of position transducers (see *CCT series*)

Technical characteristics:

- Standard ISO 6022 and DIN 24333
- Nominal pressure 25 MPa
- Maximum pressure 32 MPa
- Bore 50-320 mm
- Stroke up to 4000 mm
- Single or double rod
- 5 Mounting styles Ref. ISO ISO MF3 - MF4 - MT4 - MP5 - EB (*basic execution*)

Options:

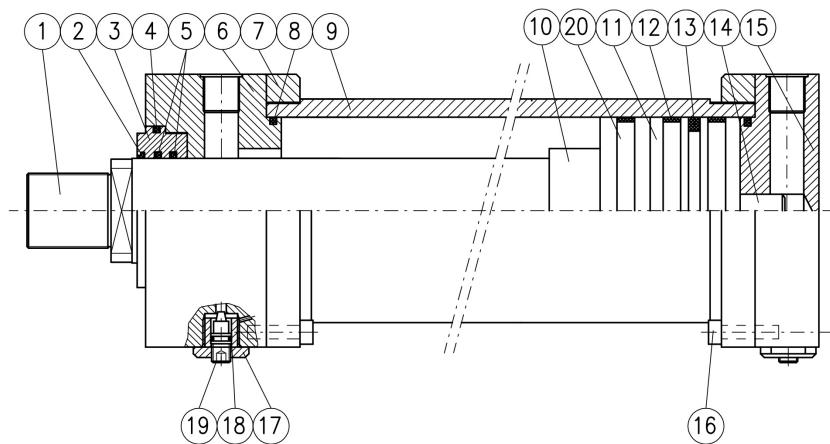

- Fixed or adjustable cushions
- Proximity sensor integrated in cylinder heads
- Magnetostrictive position transducer integrated with analogue output signal (intensity or tension) or digital output signal (SSI, CAN-open, PRODIFUB-DP or IO/LINK) (see *CCT series*)
- Air bleeds
- Rod treatment : chromed, induction hardened and chromed, nickel-chromed
- Drainage
- Subplate CETOP 03/05

Configuratore EPC

This is an innovative tool that allows the client to configure CC cylinders in a rapid and intuitive way, guiding the technician through the choices of all the options available. Once the cylinder code is defined, the EPC software provides 2D, 3D and PDF drawings, and gives the user the possibility to save projects and request offers.

With the complete access, reserved to the purchasing department, it is possible to make orders directly. For all orders received through EPC an extra discount will be applied.

TECHNICAL CHARACTERISTICS

STANDARD 6022

CHOOSING THE PRODUCTION SERIES

In order to identify the production series, ensure that, while the plant is working, the operating pressures indicated for each series are not exceeded. The general dimensioning of the cylinder ensures wide safety margins. Do not exceed the maximum pressure value that corresponds to the test pressure, considering also any overpressure caused by throttle valves in the circuits and/or by vertical loads with downward rods and end of stroke cushioning (see paragraph 1.7).

We recommend adopting strokes longer by a few millimetres than the working stroke, in order to prevent the use of the cylinder's internal stops as a mechanical end of stroke. Also check that the expected working temperature and speed are consistent with the type of seals installed.

1.1 HYDRAULIC CYLINDERS – SERIES CC

The CC hydraulic cylinders are dimensioned according to standard ISO 6022;

- Manufactured according to CNC technology, with top-quality materials, they provide maximum reliability and duration
- The use of standard components during assembly facilitates the replacement of any worn components
- They can be equipped with progressive cushionings of rear and front end of stroke, consisting of self-centering spurs that can slow-down gradually the masses concerned, even of considerable size.
- The seals used are standard, and provide reliability and easy availability on the market. The available seals selection fits different speed, frequency, temperature and fluid conditions

1.2 RANGE OF USE OF CC CYLINDERS

Nominal pressure 25 Mpa (250 bar), recommended for normal use

Maximal pressure 32 Mpa (320 bar)

1.3 CYLINDER BODY

The cylinder body is made up of a top-quality thick steel tube, either cold drawn or hot laminated, with elevated thickness and accurate internal surface (roughness $RA \leq 0.4$ micron, diameter tolerance H8)

1.4 ROD

Rods are made with top-quality steel and coated with hard chrome. This surface treatment ensures proper protection against any damage and corrosion, favouring the seals' endurance. The minimum surface finish is 0.2 micron. Rods with strong chrome filling, induction-hardened, nickel/chromium plated, inox/chromed or made of special steel, can be manufactured on demand.

1.5 HEAD

Heads are made of steel and are manufactured to ensure perfect concentricity between the cylinder body, the rod bearing and the rod. Wide inner passages are manufactured to minimize any load loss when the fluid is conveyed.

1.6 PISTON

The piston is made with a special material, specially processed to ensure a concentric guide between rod cushioning sleeve, cylinder body and head cushioning bushing. A large part of the radial surface is in contact with the cylinder body. This confers considerable stability, so that any rod bending, caused by external radial loads, is minimized.

1.7 END OF STROKE CUSHIONING

The end of stroke cushioning is usually adopted on all cylinders working at a speed > 0.1 m/sec., or when loads in vertical direction are activated. This cushioning is also a safety device in case of servo-systems control equipment failure. The ratio below makes it possible to promptly calculate, based on the cylinder bore (cushioning section), the supply pressure, the cushioning length and the working speed, as well as the mass that can be cushioned by every single cylinder. This reaction limits the overpressure value to 320 bar, protecting the cylinder's components that are under stress during braking.

$$M = \frac{(p_2 \cdot S - p_1 \cdot A) \cdot 2 \cdot L_f}{V_0^2} \cdot 10^{-2}$$

[kg]

P₁ - supply pressure (bar)
P₂ - maximum pressure 250 (bar)
V₀ - working speed (m/s)
S - cushioning section **S₁** or **S₂** (cm²)
L_f - cushioning length **L_{f1}** or **L_{f2}** (mm)
A - piston area (cm²)

The cushioned mass values obtained from this ratio are simply theoretical, and Grices accepts no responsibility for the use of this ratio. The data to be inserted in the ratio to calculate the mass that can be cushioned may be obtained from the following table.

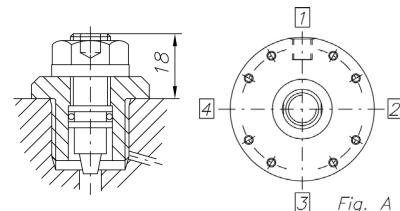

Bore (mm)	50	63	80	100	125	160	200	250	320
Ø Rod (mm)	36	45	56	70	90	110	140	180	220
S₁ (cm ²) rod forward	8,2	13,8	23,8	37,8	56	102	151	177	352
S₂ (cm ²) rod backward	18,5	29,1	46,4	73,2	114	189	294	471	748
L_f (mm)	30	30	30	32	32	40	46	95	100
A (cm ²)	19,6	31,2	50,3	78,5	122,7	201,1	314,2	490,6	803,8

The standard cushioning is in position 3 (figure A); is possible to request a different cushioning position.

1.8 CUSHIONING ADJUSTMENT

For a precise cushioning adjustment, both ends of the cylinder are equipped with control valves, as shown in figure on the right.

These devices are equipped with a system that prevents their accidental removal. These devices are located on side 3.

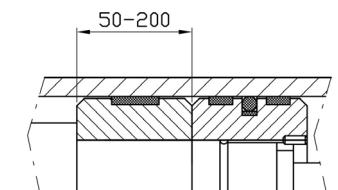

1.9 SPACERS

Cylinders with strokes > 1000mm should be equipped with spacers of adequate design that increase the rod and piston guide, in order to reduce any overload phenomena and premature wear.

The spacer allows increase of the contact surface between piston and cylinder body, improving the system rigidity. The table below indicates the spacer length based on stroke; for the stroke values not included in the table, contact our technicians. As a general rule, spacers are not mounted on cylinders when strokes are < 1000mm and on cylinders subjected to only one pulling action.

STROKE (mm)	1001 a 1500	1501 a 2000	2001 a 2500	2501 a 3000
Spacer symbol	1	2	3	4
Length (mm)	50	100	150	200

1.10 SEALS

The sealing system must be chosen according to the working conditions of the cylinder: speed, fluid type and temperature. Our cylinders feature seals provided with seats conforming to the ISO 7425 norm. That allows our cylinders to work under the heaviest conditions, such as very low or high speed, heavy working, mineral or synthetic fluids. The type of seals to be used in the relevant working conditions are indicated below:

- **TYPE B standard: (NITRILE+PTFE)** anti-friction, not recommended when loads are to be held in position, and recommended at speeds ≤ 4 m/sec., at temperatures ranging between -10 and +75°C, operation with mineral oil or glycol water.
- **TYPE C: (VITON+PTFE)** anti-friction, not recommended when loads are to be held in position, for high-temperature fluids up to +135°C, maximum speed 4m/sec. Can be used also with phosphoric esters.

Options:

- **TYPE H: (CHEVRON)** special option recommended when loads are to be held in position.
Contact our Technical Department for their availability.

1.11 OIL PORTS

Oil ports are BSP threaded, with boring conforming to DIN 3852/2, standard position 1 in figure A; other alternative positions can be provided on demand. Supplies with ISO 6162-2 compatible drilling for mounting SAE 6000 psi flanges are available on request (*contact our Technical Department*).

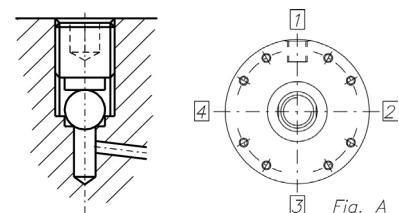

In order to reduce as much as possible any turbulence and water hammer in the cylinder's connecting pipes, ensure that the oil speed does not exceed 6 m/sec. The maximum flow rates that can be obtained with these criteria are shown in the table below.

OIL PORT Ø	1/2"	3/4"	1"	1 1/4"	1 1/2"	2"
MAX. FLOW RATE (l/mm)	40	53	85	136	212	320

*SAE flanges option: ask our technical department for availability and dimensions

1.12 AIR BLEEDS

Air bleeds are provided on demand on both ends of the cylinder. Bleeds are mounted inside the head and the bottom, so as to be protected from any accidental removal, as shown in the figure on the right. Standard position: 2 in figure A; other alternative positions can be provided on demand.

**1.13 DRAINAGE**

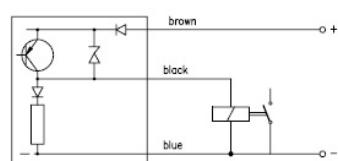

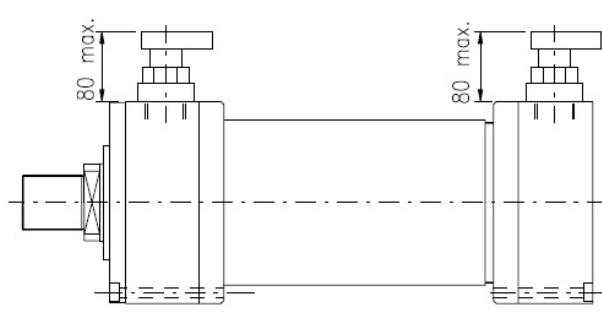

The drainage on the rod seal ensures better sealing at high speed, in particular in cylinders with strokes > 2000mm or in applications where the rod side chamber is constantly under pressure. The drainage port (1/8") is usually positioned on the same axis of the supply port and must be directly connected to the tank.

1.14 PROXIMITY SENSORS

When the piston position needs to be detected in any hydraulic system, proximity sensors can be mounted directly in the cylinder heads. The operating temperature is -25 to +80°C. Allowed dynamic pressure 350 bar.

The sensor is provided with a built-in amplifier, with direct supply (10 to 30Vdc) with an analogue PNP output for 200mA max., supplied complete with connector with a 4m long cable.

Sensors can be mounted on head and bottom, and are arranged on side 4 of the cylinder. It is possible to demand a different positioning. They make it possible to obtain an electric signal near the end of stroke positioning of the piston.

Technical data of the sensor:

Working temperature	-25 +80 °C
Supply voltage	10–30 V cc
Load	200 mA
Execution	PNP
Output type	NA

2.1 PEAK LOAD

When the cylinder is working under compression, check the rod diameter at peak load. **Table 1** shows the most common types of restriction. Each of them is associated to a coefficient **K**.

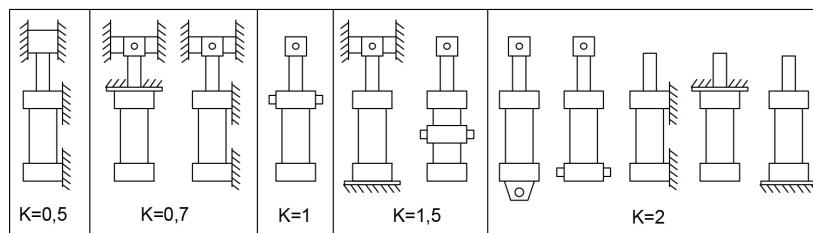

The maximum stroke of cylinder **L** multiplied by coefficient **K** produces the **LV** value (virtual length, $LV = L \cdot K$).

Graph 2 indicates the rod's minimum diameter, based on load. The point of intersection between **LV** in mm. and pushing force **F** in **kN** must be below the characteristic curve of the rod to be checked.

Example: cylinder **CC63/45/750/FA/00B** (front flange) employs a **40 kN**.

Table 1 shows coefficient **K**, determined by the type of restriction **K = 2**, the virtual length is **LV = L * K LV = 750 * 2 = 1500 mm**.

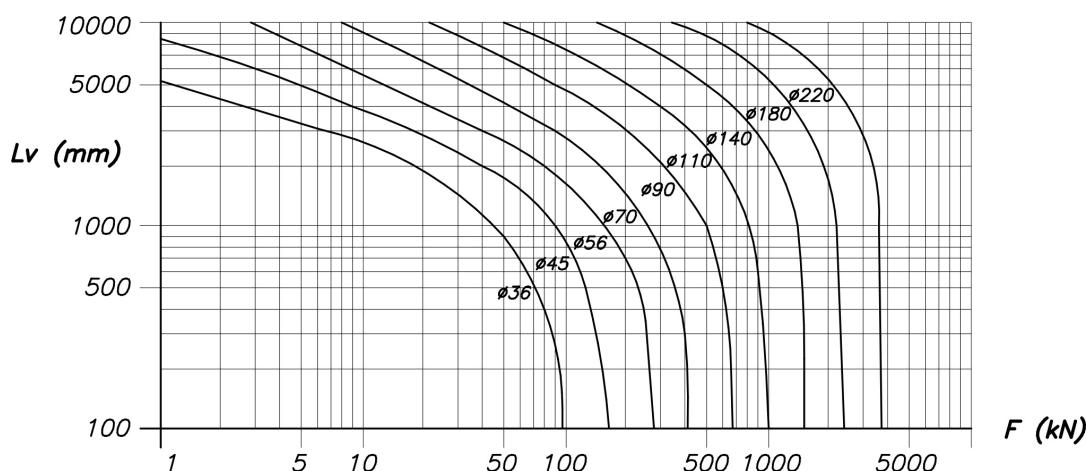

Tabella 1

In **graph 2** you can check whether the point of intersection between **LV** and **F** is below the curve of rod $\varnothing 45$.

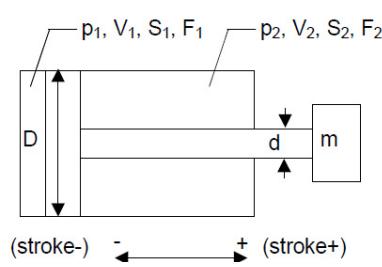

Once the stability condition has been met the rod $\varnothing 45$ can be adopted. If the result was negative (intersection point of **LV** and **F** over the curve) you should choose a cylinder with a larger rod.

Graph 2

2.2 PRACTICAL UNIT OF MEASUREMENT

DESCRIPTION	SYMBOL	UNIT OF MEASURE
Section	S	cm ²
Pressure	p	bar
Ø piston	D	mm
Ø rod	d	mm
Speed	V	m/s
Capacity	Q	l/min
Load	m	kg

PUSHING FORCE (STROKE +)

$$F_1 = (p_1 \cdot S_1) \text{ (Kg)}$$

PULLING FORCE (STROKE -)

$$F_2 = (p_2 \cdot S_2) \text{ (Kg)}$$

PUSHING SPEED (STROKE +)

$$V_1 = Q / (6 \cdot S_1) \text{ (m/s)}$$

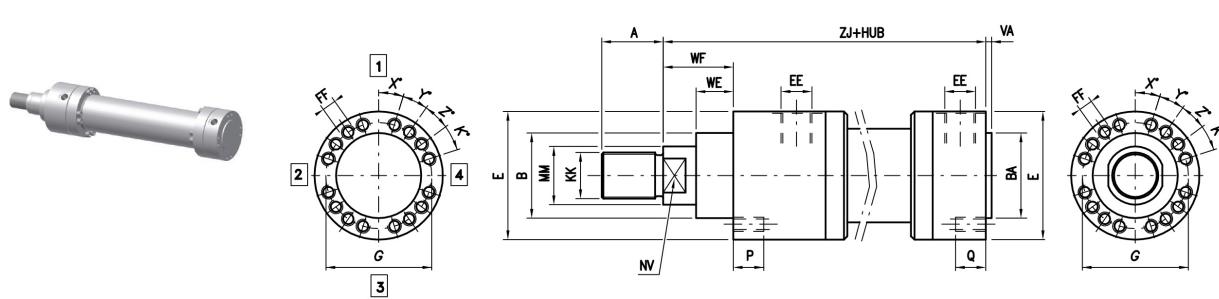

PULLING SPEED (STROKE -)

$$V_2 = Q / (6 \cdot S_2) \text{ (m/s)}$$

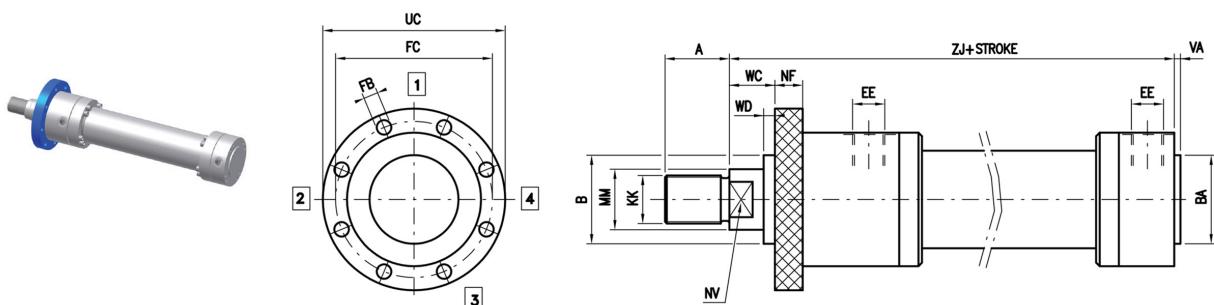

$$S_1 = \frac{\pi \cdot D^2}{4 \cdot 100} \text{ (cm}^2\text{)}$$

$$S_2 = \frac{\pi \cdot (D^2 - d^2)}{4 \cdot 100} \text{ (cm}^2\text{)}$$

Login at: <http://configuratore.grices.it/>

Configure your cylinder in a quick and intuitive way choosing all the available options.

Note

The indicated operating pressures are efficient for smooth applications without blows. For extreme loads or high operating pressures with high frequency, it is necessary to use mounting styles and thread-rod links designed to be stress-resistant.

For further information contact our Technical Department.

CCT CYLINDERS SERIES

STANDARD ISO 6022

CCT cylinders series integrates magnetostrictive transducers and follows International standards **ISO 6022** and **DIN 24333**. The construction with round heads fits to the most demanding and challenging industrial actuation requests in the iron and steel industry, with continuous nominal pressure up to **25 MPa**.

The choice of selected materials, the severe controls of 100% of all cylinders produced and the quality of the means of production, allows us to reach high standards of quality, reliability and enduring product performance.

The seals used, supplied by premium suppliers, grant high performance and international availability. The wide range of seals, allows us to offer cylinders for applications with different kinds of hydraulic fluids, speed, frequency and operating temperature.

Technical specifications:

- Standard ISO 6022 and DIN 24333.
- Magnetostrictive position transducer integrated with analogue output signal (intensity or tension) or digital output signal (SSI, CAN-open, PROFIBUS-DP or IO/LINK)
- Nominal pressure 25 MPa
- Maximum pressure 32 MPa
- Bore 50-320 mm
- Stroke: up to 4000 mm
- 4 Mounting styles Ref. ISO MF3 - MT4 - MP5 - EB (*basic execution*)

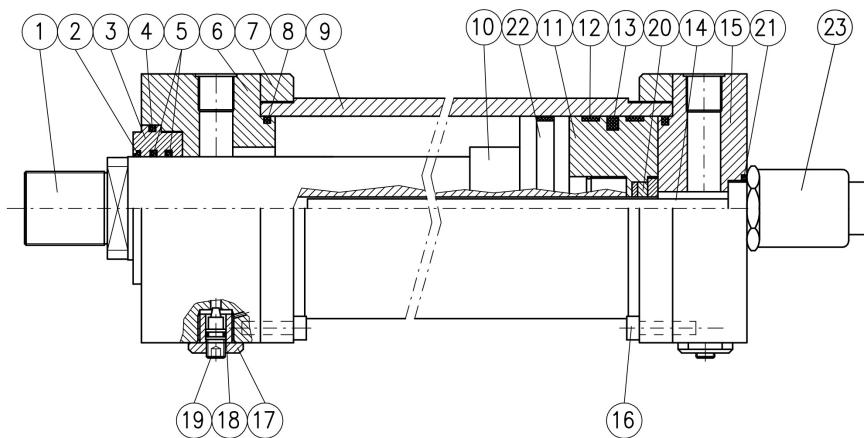

Options:

- Analogue output signal: 4/20 mA or 0/10 V
- Digital output signal: SSI, CAN-open, PROFIBUS-DP or IO/LINK
- Front cushioning
- Air bleeds
- Rod treatment : chromed, induction hardened and chromed, nickel-chromed
- Drainage
- Subplate CETOP 03/05
- Protection case

EPC Cylinder configurator

This is an innovative tool that allows the client to configure CCT cylinders in a rapid and intuitive way, guiding the technician through the choices of all the options available. Once the cylinder code is defined, the EPC software provides 2D, 3D and PDF drawings, and gives the user the possibility to save projects and request offers. With the complete access, reserved to the purchasing department, it is possible to make orders directly. For all orders received through EPC an extra discount will be applied.

LINEAR POSITION TRANSDUCERS

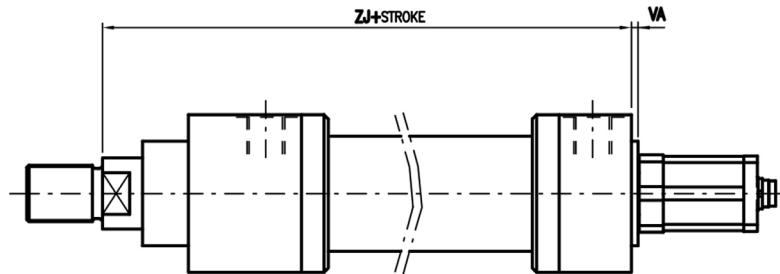

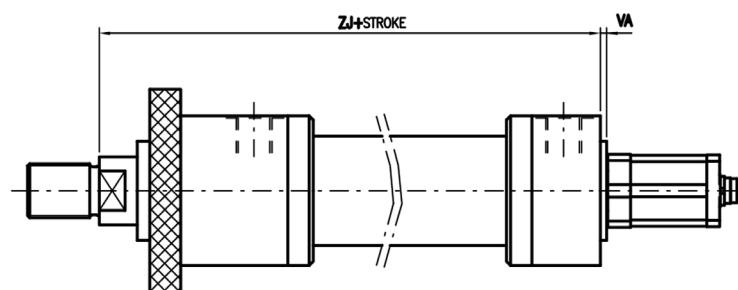

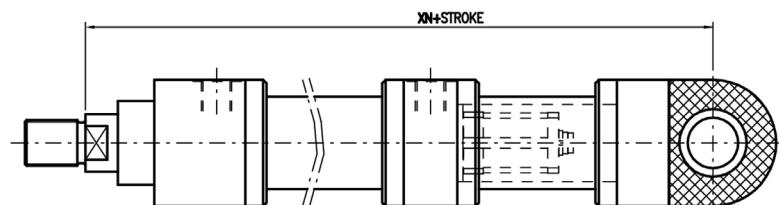

To immediately check the rod position, install a linear position transducer.

The magnetostrictive technology allows rod position detection even in heavy duty conditions and/or high frequency applications, avoiding the contact between the moving parts.

The transducer, in addition to offering a high reliability, permits an easy maintenance. Its replacement does not require the cylinder dismounting.

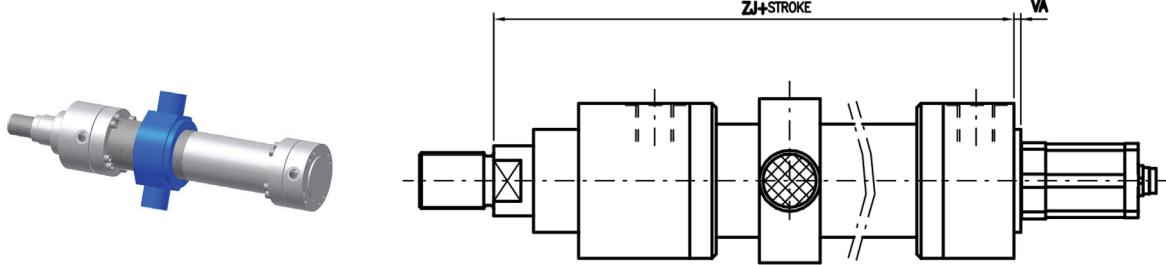

Analogue or digital versions are available.

Resolution	0,01 mm
Independent linearity	±0,05 % (% of the total stroke)
Repeatability	±0,01 % (% of the total stroke)
Max. speed	2 m/sec
Working temperature	-20 +80 °C
Analogue/digital signal	0+10 V 10+0 V or 4+20 mA / SSI, CAN OPEN, PROFIBUS DP, IO/LINK
Strokes	50÷3850 mm
Max. transducer pressure	35 MPa (350 Bar)
Power supply	24 V DC ±10 %
Protection degree (connector installed)	IP-67

CB CYLINDERS SERIES

SHORT STROKE COMPACT
WITH ADJUSTABLE MAGNETIC SENSORS

The **CB series** comprises compact cylinders with short stroke and adjustable **magnetic sensors**.

The particular small size and the restrained weight make these cylinders ideal for moulding applications of plastics and locks.

The choice of selected materials, the new superficial treatment, the severe controls of 100% of all cylinders produced and the quality of the means of production, grant high standards of quality, reliability and enduring product performance.

The seals used, supplied by premium suppliers, grant high performance and international availability.

The wide range of seals, allows us to offer cylinders for applications with different kinds of hydraulic fluids, speed, frequency and operating temperature.

Technical specifications:

- Adjustable proximity sensors type SEP "Hall effect" IP67
- Adjustable proximity sensors type SER "Reed effect" IP67
- Nominal pressure 16 MPa
- Maximum pressure 25 MPa
- Bore 25-100 mm
- 4 Mounting style
- Body extracted from full block with rear head integrated
- New treatment of hard anodic oxidation
- Improved endurance to usury and abrasion
- Surface hardness increased to 400-600 Vickers

Options:

- Chromed/inox AISI316 rod
- Standard version
- Magnetic version
- Viton seals (only in N version)

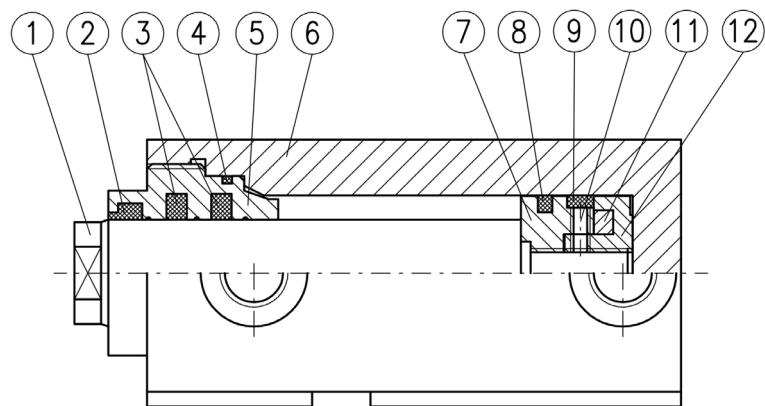

EPC Cylinder configurator

This is an innovative tool that allows the client to configure CB cylinders in a rapid and intuitive way, guiding the technician through the choices of all the options available. Once the cylinder code is defined, the EPC software provides 2D, 3D, and gives the user the possibility to save projects and request offers.

With the complete access, reserved to the purchasing department, it is possible to make orders directly.

For all orders received through EPC an extra discount will be applied.

CL CYLINDERS SERIES

WELDED CYLINDERS

The **CL series**, welded cylinders with accessible prices, is suitable for the mobile sector or for applications which do not present cyclical fatigue stress.

The choice of selected materials, the hydraulic and electronic controls of 100% of all cylinders produced and the quality of the means of production, allow to reach high standards of quality, reliability and enduring product performance.

The seals used, supplied by premium suppliers, grant high performance and international availability.

The wide range of seals, allows us to offer cylinders for applications with different kinds of hydraulic fluids, speed, frequency and operating temperature

Technical characteristics:

- Nominal pressure 14 MPa
- Maximum pressure 21 MPa
- Bore 40-100 mm
- Stroke up to 4000 mm
- Single or double rod
- 2 rod diameter per bore
- 6 mounting styles
- 3 versions of rod mounting styles

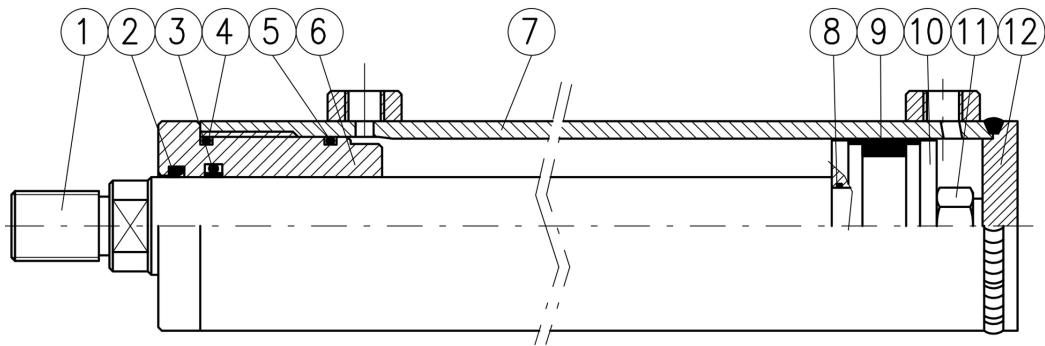

Options:

- Integrated position transducer with analogue output signal: 4/20 mA or 0/10V (contact our technical department)
- Air bleeds
- Rod treatment : chromed, induction hardened and chromed, nickel-chromed

EPC Cylinder configurator

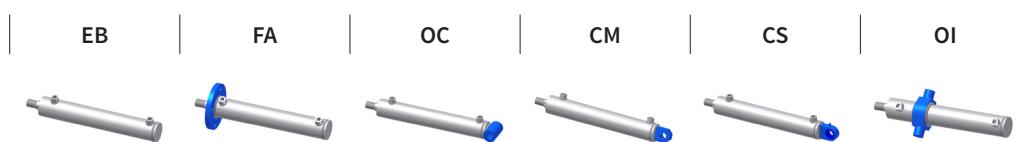

This is an innovative tool that allows the client to configure CL cylinders in a rapid and intuitive way, guiding the technician through the choices of all the options available. Once the cylinder code is defined, the EPC software provides 2D, 3D and PDF drawings, and gives the user the possibility to save projects and request offers. With the complete access, reserved to the purchasing department, it is possible to make orders directly. For all orders received through EPC an extra discount will be applied.

Login at: <http://configuratore.grices.it/>

Configure your cylinder in a quick and intuitive way choosing all the available options.

Note

The indicated operating pressures are efficient for smooth applications without blows. For extreme loads or high operating pressures with high frequency, it is necessary to use mounting styles and thread-rod links designed to be stress-resistant.
For further information contact our Technical Department.

CE CYLINDERS SERIES

WELDED CYLINDERS

The **CE series**, welded cylinders with ample guides and accurate processing, is suitable for the usage on industrial and mobile machines, for applications without cyclical fatigue stress.

The choice of selected materials, the hydraulic and electronic controls of 100% of all cylinders produced and the quality of the means of production, allow to reach high standards of quality, reliability and enduring product performance.

The welding process is carried out with the help of special machines by our qualified and certified staff.

The seals used, supplied by premium suppliers, grant high performance and international availability.

The wide range of seals, allows us to offer cylinders for applications with different kinds of hydraulic fluids, speed, frequency and operating temperature.

Technical specifications:

- Nominal pressure 16 MPa
- Maximum pressure 25 MPa
- Bore 40-200 mm
- Stroke up to 4000 mm
- Single or double rod
- 2 rod diameter per bore
- 8 mounting styles

Options:

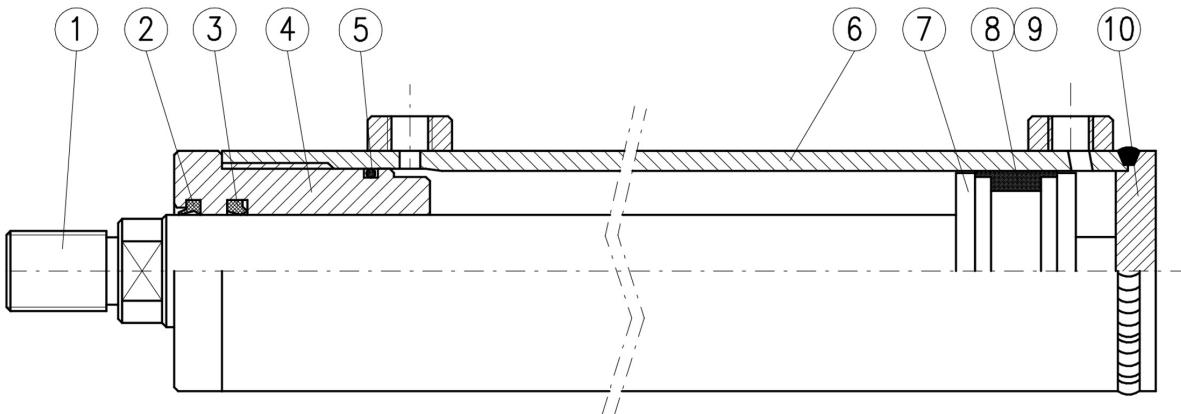

- Integrated position transducer with analogue output signal: 4/20 mA or 0/10 V (contact our technical department)
- Air bleeds
- Rod treatment : chromed, induction hardened and chromed, nickel-chromed

EPC Cylinder configurator

This is an innovative tool that allows the client to configure CE cylinders in a rapid and intuitive way, guiding the technician through the choices of all the options available.

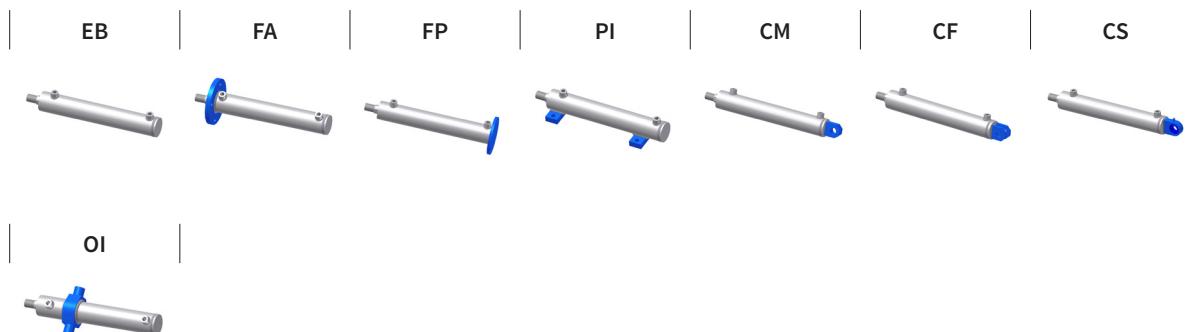

Once the cylinder code is defined, the EPC software provides 2D, 3D and PDF drawings, and gives the user the possibility to save projects and request offers. With the complete access, reserved to the purchasing department, it is possible to make orders directly. For all orders received through EPC an extra discount will be applied.

* Specify the possible **extra-rod (X)** size in addition to the standard rod protrusion:

Login at: <http://configuratore.grices.it/>

Configure your cylinder in a quick and intuitive way choosing all the available options.

Note

The indicated operating pressures are efficient for smooth applications without blows. For extreme loads or high operating pressures with high frequency, it is necessary to use mounting styles and thread-rod links designed to be stress-resistant. For further information contact our Technical Department.

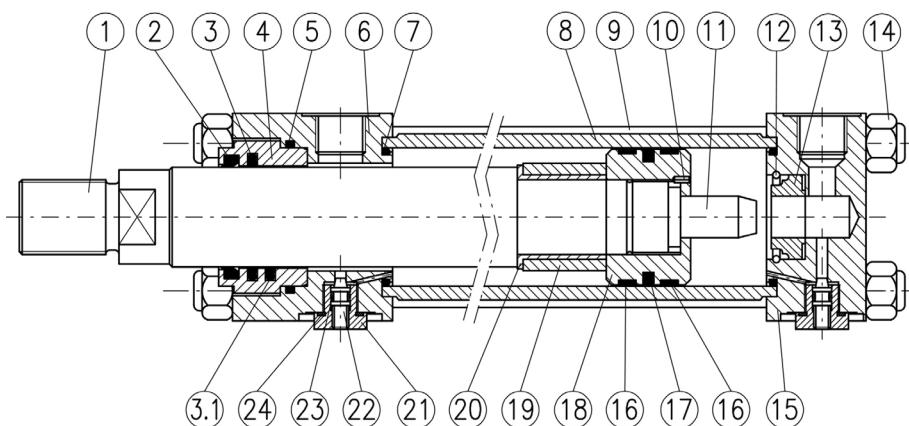

KIT COMPONENTS CH SERIES

STANDARD ISO 6020/2 - 1991 -
DIN 24554 160 BAR COMPACT SERIES

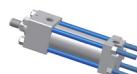

Grices offers assembly kits for the CH series (ISO 6020/2) and the CHM (ISO 6020/2 magnetic), the simple assembling process does not require any particular equipment.

The offer includes all the standard mounting styles that follow the ISO 6020/2 standard; the components' modularity reduces the necessity to stock, since the high flexibility of the configurations makes them suitable for multiple applications.

N°	ITEM	MATERIAL
1	Rod	Chromium-plated steel
2	Scraper	Polyurethane / PTFE
3	Rod seal	Polyurethane / PTFE
3.1	2nd Rod seal (option L)	NBR e PTFE
4	Guide sleeve	Spheroidal cast iron
5	O-Ring + PBK	NBR + Polyurethane
6	Head	Steel
7	O-Ring + PBK	NBR + Polyurethane
8	Body	Steel
9	Tie rod	Steel
10	Safety pin	Steel
11	Cushioning spur	Steel
12	Toroidal ring	Steel

ATTACHMENTS FOR HYDRAULIC CYLINDERS

STANDARD ISO/DIN
SPECIAL ACCESSORIES

A wide range of accessories for cylinders:

- Spherical rod eye
- Rod clevis
- Rod eye plain
- Pivot pin
- Straight clevis bracket
- Angled clevis bracket
- Eye bracket
- Trunnion bracket following ISO 6982, ISO 8133, ISO 8132, DIN 24556.

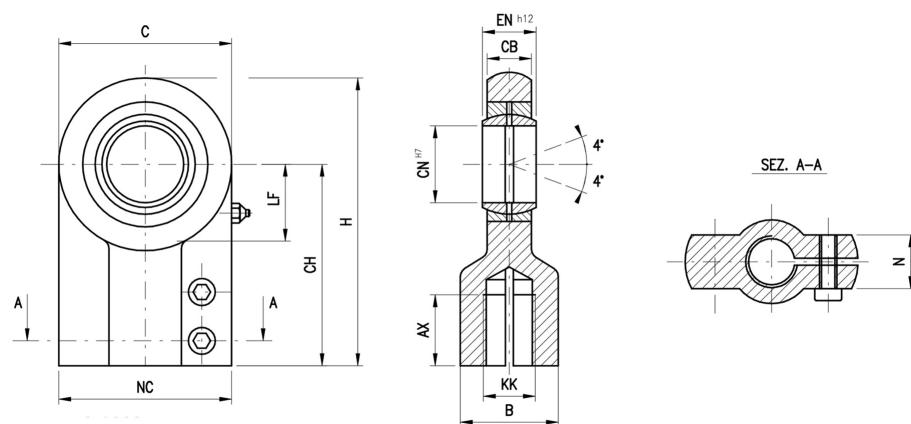

EPC Cylinder configurator

This is an innovative tool that allows the client to configure cylinders and accessories in a rapid and intuitive way, guiding the technician through the choices of all the options available. Once the cylinder code is defined, the EPC software provides 2D, 3D and PDF drawings, and gives the user the possibility to save projects and request offers.

With the complete access, reserved to the purchasing department, it is possible to make orders directly. For all orders received through EPC an extra discount will be applied.

MXO NAVAL CYLINDERS

INOX AISI 316

BRASS OT58 CHROMED

The **MXO series** is part of the **nautical standard** Grices production.

The usage of stainless steel **AISI 316** assures the total absence of corrosion. The sleek and smooth design makes this series suitable for nautical applications with continuous nominal pressure up to **12 MPa**.

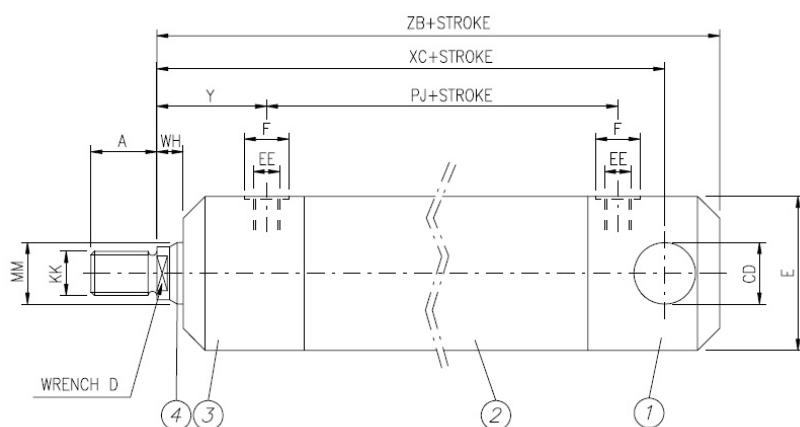

The choice of selected materials, the severe controls of 100% of all cylinders produced and the quality of the means of production, allows us to reach high standards of quality, reliability and enduring product performance.

The seals used, supplied by premium suppliers, grant high performance and international availability

Technical characteristics:

- Nominal pressure 12 MPa
- Maximum pressure 16 MPa
- Bore: 40-50 mm
- Stroke: up to 1000 mm
- Seals: Elastomer + nitrile, high sealing capacity

Login at: <http://configuratore.grices.it/>

N°	ITEM	MATERIAL
1	Rear head	Chromium-plated brass
2	Tube	AISI 316 stainless steel
3	Front head	Chromium-plated brass
4	Rod	AISI 316 stainless steel

ORDER ACRONYM

In orders report the acronym followed by stroke length in mm.

Example: MXO 40/500 (stroke 500)

CODE	AL	MM	A	CD	D	E	F	EE	KK	PJ	WH	XC	Y	ZB
MXO 40	40	28	28	20	22	60	22	1/4"	M20x1,5	119	12	194	53	214
MXO 50	50	28	28	20	22	70	22	1/4"	M20x1,5	124	12	199	53	219

MXP NAVAL CYLINDERS

INOX AISI 316

BRASS OT58 CHROMED

The **MXP series** is part of the **nautical standard** Grices production.

The usage of stainless steel **AISI 316** assures the total absence of corrosion. The addition of a power source from the rear pivot pin and the resulting removal of external hoses, makes the application suitable for a sleek design.

The choice of selected materials, the severe controls of 100% of all cylinders produced and the quality of the means of production, allow to reach high standards of quality, reliability and enduring product performance. The seals used, supplied by premium suppliers, grant high performance and international availability.

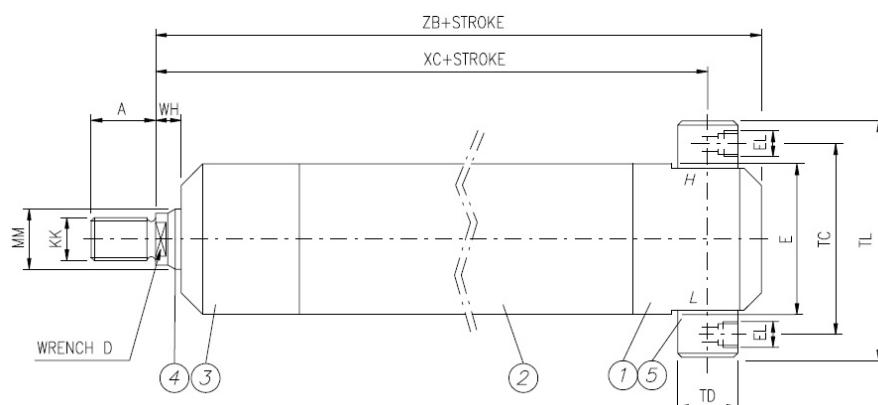

Technical specifications:

- Nominal pressure 12 MPa
- Maximum pressure 16 MPa
- Bore: 40-50 mm
- Stroke: up to 1000 mm
- Seals: Elastomer + nitrile, high sealing capacity
- Power source from rear pin

Options:

- STP fixing brackets of the cylinder to boat stern.

Login at: <http://configuratore.grices.it/>

N°	ITEM	MATERIAL
1	Rear head	Chromium-plated brass 58
2	Tube	AISI 316 stainless steel
3	Front head	Chromium-plated brass 58
4	Rod	AISI 316 stainless steel
5	Pin	AISI 316 stainless steel

ORDER ACRONYM

In orders report the acronym followed by stroke length in mm.

Example: **MXP 40/500** (stroke 500)

COD	AL	MM	A	D	E	EL	KK	TC	TD	TL	WH	XC	ZB

COA NAVAL CYLINDERS

INOX AISI 316

BRASS OT58

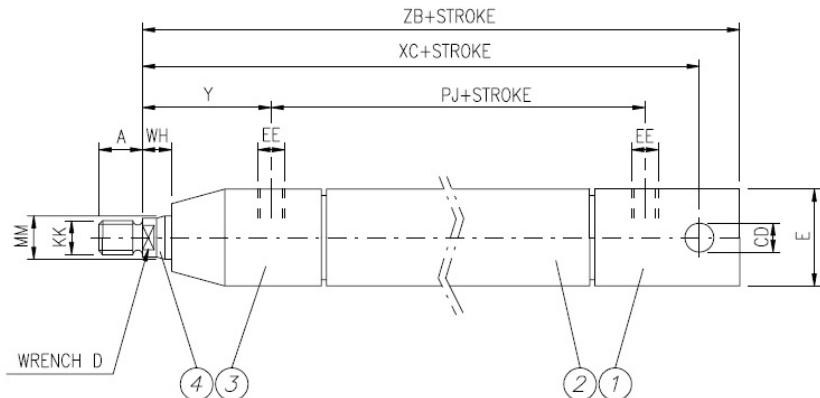

The **COA series** is part of the nautical standard Grices production. The usage of **AISI 316** stainless steel and OT58 brass assures the total absence of corrosion. The sleek and smooth design makes this series suitable for nautical applications in particular for ramp movement and gangway extraction, with continuous nominal pressure up to **8 MPa**.

The choice of selected materials, the severe controls of 100% of all cylinders produced and the quality of the means of production, allows us to reach high standards of quality, reliability and enduring product performance. The seals used, supplied by premium suppliers, grant high performance and international availability.

Technical specifications:

- Nominal pressure 8 MPa
- Maximum pressure 12 MPa
- Bore: 30-40 mm
- Stroke: up to 2000 mm
- Seals: Elastomer + nitrile, high sealing capacity

Login at: <http://configuratore.grices.it/>

N°	ITEM	MATERIAL
1	Rear head	Brass
2	Tube	Brass
3	Front head	Brass
4	Rod	AISI 316 stainless steel

OPERATING INSTRUCTIONS FOR HYDRAULIC CYLINDERS

INSTALLATION

- Mounting and placing in service must be carried out by qualified staff, following the instruction for use.
- Do not exceed the maximum working conditions.
- Assure that the seals are compatible with the hydraulic fluid used
- Use the specific fluid during entire product lifetime
- The rod must be carefully handled to avoid damages on the superficial covering that could reduce the reliability and the operating principles
- Lateral forces on the rod must be avoided
- Mount the cylinder avoiding misalignment between rod and fixing device; when small alignment errors are expected, a spherical joint must be used.
- Proximity sensors are calibrated before the shipping. In case of need of further regulations contact our technical department
- Do not remove the sensor on pressured cylinders
- Do not remove the transducers on pressured cylinders
- While the supply is turned on, do not connect or disconnect the connectors
- Assure that the hoses are conformed for the requested maximum pressure and capacity.
- Assure that the connections are fastened before pressurising the system
- Vent the system and the cylinder
- Fill the cylinder slowly to avoid sudden movement
- If necessary, calibrate cushioning valves to obtain the best performance

MAINTENANCE

- Fluids loss must be checked regularly. In case of fluid loss, the seals must be replaced with original Grices seals.
- Assure that the hydraulic fluid cleanliness follows the ISO 17/14 class standard.
- Check that the rod chromed surface is not damaged: damage can suggest oil contamination or excessive lateral load.
- Determine the lubrication of spherical joints, pivots and other non self-lubricated parts.
- The rod must be retracted during the system extended stop.
- In case of replacement necessity, follow these points.
- Use only original replacements supplied by Grices.
- Assure possessing all the necessary tools in order to accomplish the replacement without damaging the components.
- Disassemble and reassemble the cylinder in the right order.
- Rod and piston seals must be assembled in the right position.
- Use the right tightening torque to screw bolts and nuts.
- The replacement time of components susceptible to wear, such as seals, joint ends and guide bands depends on cylinder's working conditions.
